AMBULANCE REROUTING CRITERIA

(Abbreviated version - see Ambulance Rerouting policy in the Administration Manual for the complete policy)

REASONS FOR REROUTING OF AMBULANCES – Conditions that may necessitate REROUTING are:

► **CT Failure** - When the CT scanner is inoperative, patients demonstrating neurological signs/symptoms of stroke, or acute head injury will be diverted

► **Trauma Center Overload** - When it has been determined that the hospital is unable to meet the criteria for a Level II Trauma Center in Alameda County (O.R. is full)

► **STEMI Diversion** - STEMI/Cardiac Arrest Receiving Centers may divert due to diagnostic or treatment equipment failure or scheduled maintenance for patients experiencing acute MI or post cardiac arrest

► **Stroke Center Diversion** - Certified Stroke Centers may divert due to diagnostic or treatment equipment failure or scheduled maintenance for patients exhibiting signs of acute stroke symptoms/stroke alert

► **Extended Wait Times “Bypass”** - In the event a hospital is holding two or more ambulances for more than thirty (30) minutes, incoming ambulances may be rerouted and facility placed on bypass by an EMS transport provider supervisor for all non-critical patients until ED resolves transfer of care issues with ambulance service provider(s)

► **Physical Plant Casualty (Internal Disaster)** - An unforeseeable physical or logistical situation/circumstance - (e.g., fire, bomb threat, power outage, etc.) that curtails routine patient care and renders continued routine ambulance delivery unsafe. A receiving hospital or trauma center may divert any patient, including critical trauma patients (CTP) as deemed necessary by the facility during this type of incident. The hospital must come off Physical Plant diversion immediately upon resolution of the issue

EXCEPTIONS the following patients **may not** be rerouted when a hospital is placed on “bypass”:

► Patients requiring “Specialty Center” services (i.e. Trauma, STEMI, Stroke)

► Obstetric patients who may require imminent delivery (e.g. - if baby is crowning, patient exhibiting delivery complications, etc.)

► Sexual assault patients (see policy #7006 for destination information pertaining to sexual assault). Specialized teams are available at Highland, Children’s and Washington EDs

► Direct admits - Receiving hospital MD has accepted the patient as a direct admit with an assigned hospital bed

► Patients with any uncontrollable problem in whom diversion would be life/limb threatening. (e.g. - unmanageable airway, uncontrolled hemorrhage, unstable cardiopulmonary condition, full arrest etc.)

► Unstable patients who in the judgment of the paramedic may experience greater risk by being transported to an alternate hospital than the hospital on “bypass”. The patient should be transported to the closest most appropriate facility in accordance with the Alameda County EMS Transport Guidelines policy

► Any patient who requests a specific facility. Field personnel should explain the hospital's circumstances and that a wait for service is possible; however, if the patient continues to insist on transport, the patient should be transported to the hospital on “bypass” (excluding specialty interventions)

### Certifications

| Sonya Lee | 618-2034  
| sonya.lee@acgov.org |
**CERTIFICATION | RECERTIFICATION | ACCREDITATION CHECKLIST**

### EMT INITIAL CERTIFICATION
- A signed EMT Certification application (available at [http://www.acphd.org/ems](http://www.acphd.org/ems) or from the EMS Agency).
- A copy of your EMT course completion certificate.
- A copy of your NREMT card.
- A copy of your driver’s license, ID card, or valid military ID card (with photo).
- A copy of your completed Live Scan application.
- Pay the application fee (online, money order, cashier’s check or municipal purchase order payable to Alameda County EMS - no personal checks or cash).

### EMT RECERTIFICATION
- A signed EMT Recertification application (available at [http://www.acphd.org/ems](http://www.acphd.org/ems) or from the EMS Agency).
- A copy of the front and back of your signed CPR card.
- A copy of your driver’s license, ID card, or valid military ID card (photo id).
- Copies of your continuing education certificates or your refresher certificate.
- A copy of your Skills Verification form.
- A copy of your completed Live Scan application form if this is your first recertification with Alameda County EMS.
- Pay the application fee (money order, cashier’s check or municipal purchase order payable to Alameda County EMS - no personal checks or cash).
- If your certificate has expired, see EMT Certification policy # 3200 (Administration Manual).

### MAINTAINING PARAMEDIC ACCREDITATION
Your accreditation is continuous as long as you:
- Maintain your California Paramedic license.
- Are employed by an approved paramedic provider agency.
- Meet local requirements for updates in local policy, procedure, protocol and local optional scope of practice, and comply with the requirements in the system-wide quality improvement program (policy # 2000).

If any of the above requirements are not met or maintained, accreditation to practice shall be withdrawn until successful completion of the requirement(s). A paramedic whose accreditation has been withdrawn for more than one year shall be required to re-apply for initial accreditation. You may only work in your basic scope of practice until your accreditation is current.

This is an abbreviated version of the requirements. For more information see the EMT Certification policy (# 3200) and Paramedic Accreditation policy (# 3302) in the EMS Administration Manual.

AN OVERVIEW OF PATIENT CARE POLICIES

1. **Treatment algorithms should be used as a guideline and are not intended as a substitute for sound medical judgment. Unusual patient presentations make it impossible to develop a protocol for every possible patient situation**

2. Patient care protocols are to be utilized by field personnel and Base Hospital Physicians. All procedures and/or medications must be within the scope of practice for field personnel and authorized in Alameda County policies.

3. Where scope of practice allows, cardiovascular protocols are consistent with current American Heart Association, Emergency Cardiovascular Care guidelines.

4. Medications/Procedures contained in [non-shaded boxes] may be performed without base contact, or may be called in to the base hospital for consultation with the Base Hospital Physician.

5. Medications/Procedures contained in *shaded boxes* require a Base Physician order.

6. **Base contact - Paramedics should contact the Base Physician for consultation:**
   6.1 At any point in a policy or treatment algorithm where base hospital contact is required and/or any time consultation would be in the patient’s best medical interest.
   6.2 For complicated patient presentations or in situations where a deviation from the standard protocol seems indicated.
   6.3 For any patient attended by a physician at the scene. (See “Medical Personnel on the Scene - page 108”)
   6.4 For out-of-protocol medication administration. Unusual circumstances may indicate special applications of medications carried by paramedics that are not covered in the treatment algorithms (e.g. glucagon for beta-blocker overdose).
   6.5 An EMT may make base contact for consultation with a physician for destination decisions, unusual patient presentations, and/or procedures within the EMT scope of practice. **An EMT may not make base contact or accept orders for the patient on behalf of a paramedic.**

7. If direct communication with the Base Physician cannot be made or maintained, consider immediate transport and attempt base contact en route, if applicable.

8. If a difference between policies exists, the policy with the most recent date prevails.
1. **CHILD ABUSE / ELDER ABUSE / DOMESTIC VIOLENCE:** In any situation where the rescuer has reason to suspect Child or Elder abuse, or Domestic Violence:

   1.1 Immediately notify the appropriate law enforcement agency
   1.2 Reasonable effort will be made to transport the patient to a receiving hospital for evaluation. Immediately inform hospital staff of your suspicions
   1.3 Document all pertinent observations on the patient care report
   1.4 Immediately (or as soon as practical) contact the appropriate agency by telephone and give a verbal report
   1.5 A written report for child/elder abuse must be filed within 36 hours

   ➤**TO REPORT CHILD ABUSE:**
   Child Protective Services
   24100 Amador St.
   Hayward, CA 94544
   (510) 259-1800 - 24 hour number

   ➤**TO REPORT ELDER OR DEPENDENT ADULT ABUSE:**
   ➔ By staff at a licensed health care facility contact:
   Ombudsman (800) 231-4024
   ➔ At home, or by a visitor or another resident at a licensed health care facility contact:
   Adult Protective Services
   6955 Foothill Blvd., Suite 300
   Oakland, CA 94605
   (866) 225-5277 - 24 hour number
   After 5 pm M-F and weekends, an operator answers this line and can page a social worker (if needed.) If the patient was assaulted or has suffered serious neglect contact local law enforcement.

   ➤**TO REPORT DOMESTIC VIOLENCE:**
   Domestic violence is defined as the willful intimidation, physical assault, battery, sexual assault, and/or other abusive behavior as part of a systematic pattern of power and control perpetrated by one intimate partner against another.
   ➔ Notify local law enforcement and receiving hospital staff
   ➔ Perform DV Lethality Screen (see section 3)

2. **SEXUAL ASSAULT:** Patients should be transported to the appropriate facility for evaluation regardless of the hospital’s diversion status

   2.1 **Adult patients:** Alameda County Medical Center or Washington Hospital
   2.2 **Pediatric patients:** Children’s Hospital (≤14 y.o.)
3. DOMESTIC VIOLENCE (DV) LETHALITY SCREEN

3.1 Determine level of distress – is patient injured or complaining of any medical complaints?
   ► Assess and treat as appropriate
   ► If patient c/o or presents with medical complaints, assess for signs & symptoms of possible strangulation
   ► Attempt private audience with patient (maintaining regard for safety)

   ► If feasible, Conduct DV Lethality screen AND call Family Violence Law Center (FVLC) hotline and hand patient the phone. (800) 947-8301
   (must be completed on electronic PCR to complete mandated reporting)

   ► If patient is NOT transported
      ➔ If patient declines to speak with the FVLC advocate, provide patient with resource information and advise that she/he can call 24/7
      ➔ Repeat basic safety planning tips that the advocate provides
   ► If patient is transported, be sure to inform receiving facility of lethality risk (if performed, as determined by screen) and DV advocacy steps taken

3.2 Questions used in the Domestic Violence Lethality Screen for First Responders

   This screen is not to be used by any law enforcement agencies or other first responders unless trained in the proper use of the Lethality Assessment Program protocol

   ➔ A “yes” response to any of Questions 1–3 automatically triggers the protocol referral
      1. Has he/she ever used a weapon against you or threatened you with a weapon?
      2. Has he/she threatened to kill you or your children?
      3. Do you think he/she might try to kill you?
   ➔ Negative responses to Questions 1–3, but positive responses to at least four of Questions 4–11, trigger the protocol referral
      4. Does he/she have a gun or can he get one easily?
      5. Has he/she ever tried to choke you?
      6. Is he/she violently or constantly jealous or does he/she control most of your daily activities?
      7. Have you left him/her or separated after living together or being married?
      8. Is he/she unemployed?
      9. Has he/she tried to kill himself?
     10. Do you have a child that he/she knows is not his/hers?
     11. Does he/she follow or spy on you or leave threatening messages?

   Any first responder may trigger the protocol referral if not already triggered above, as a result of the victim’s response to the below question, or whenever the first responder believes the victim is in a potentially lethal situation
   ➔ Is there anything else that worries you about your safety? (If “yes”) What worries you?
BURN PATIENT CARE

A. BASIC MANAGEMENT
1. Rule out airway damage
   1.1 Assess for inhalation injury
   1.2 High flow oxygen is critical
   1.3 Be prepared for intubation
2. Assess and expose
   2.1 Assess ABC’s
   2.2 Perform a mini neurological exam - level of consciousness
   2.3 Expose and examine the patient for other areas of burn
   2.4 Remove jewelry, but do not remove stuck clothing
3. Start IV’s
   3.1 Two large bore IV’s (for major burns)
4. Give IV fluids – See ALCO PRE-HOSPITAL FLUID FORMULA Fluid resuscitation is particularly important!
5. Document severity and treat the pain
   5.1 Estimate the severity of the burns using the ABA Classification or the “Rule of 9’s”
   5.2 Treat pain. Pain management should be considered mandatory for moderate to severe burns. See Pain Management Policies – Adult (page 43) and Pediatric (page 68)
6. Protect against hypothermia and infection - dress burns
   6.1 Dry, sterile dressing for any burn involving >10% TBSA (Total Body Surface Area)
   6.2 Keep patient warm to prevent hypothermia (use sheets or blankets)
   6.3 Moist, sterile dressings are OK for small burns (<10% TBSA)
7. Elevate burned body parts - 30°
8. Address psychological needs
   8.1 Be honest and compassionate
   8.2 Consider anxiolytics – Contact Base Physician for midazolam
9. Maintain body temperature and observe for hypothermia

B. ELECTRICAL BURNS
1. Turn off the power source if patient is still attached
2. See first responder defibrillation protocol if patient is unconscious and pulseless

C. TAR BURNS
1. Do not attempt to remove the tar
2. Cool with water
3. Maintain body temperature and observe for hypothermia
D. CHEMICAL BURNS

1. Remove clothing

2. **Liquid chemicals:**
   - Flush **immediately** with copious amounts of tepid water for 10 - 15 minutes

3. **Dry chemicals:**
   - Brush off as much as possible, then flush with copious amount of tepid water for 10 - 15 minutes

4. Identify chemical

5. Assess for associated respiratory burns

---

**ALCO PRE-HOSPITAL FLUID FORMULA**

\[
\text{rate (mL/HR)} = \frac{\text{weight in kg} \times \text{TBSA} \%}{4}
\]

This formula is consistent with the Parkland Formula for determining rate of fluid administration for the first 8 hours after a major burn.

**PARKLAND FORMULA**

\[
\text{Fluid in first 24 hours} = (4 \times \text{weight(kg)}) \times \% \text{TBSA}
\]

*Give half over the first 8 hours*
BURN PATIENT CRITERIA

1. INTRODUCTION - The intent of this policy is to transport patients with critical burns, who have a manageable airway, directly to a facility that is staffed and equipped to care for the medical needs of the patient, bypassing other receiving facilities. Minor to moderate burn patients will be transported to the closest, most appropriate receiving hospital.

2. BURN PATIENT CRITERIA (from the American Burn Association – Burn Unit Referral Criteria)
   2.1 Partial thickness burns greater than 10% total body surface area
   2.2 Moderate to severe burns that involve the face, hands, feet, genitalia, perineum, or major joints
   2.3 Full thickness burns in any age group
   2.4 Electrical burns, including lightning injury
   2.5 Chemical burns
   2.6 Burn injury in patients with preexisting medical disorders that could complicate management, prolong recovery, or affect mortality

3. DESTINATION
   3.1 Adult and Pediatric patients who meet burn patient criteria 2.1-2.6 may be transported directly to an out-of-county burn center (see #5 below).
   3.2 Exceptions:
      3.2.1 Potentially unmanageable airway - (e.g. - soot in the mouth and/or nose, inhalation injury, etc.) transport to the closest trauma center.
      3.2.2 Unmanageable Airway - The patient requires intubation, and the paramedic is unable to intubate, and an adequate airway cannot be maintained with B.V.M. device, transport to closest basic E.D.
      3.2.3 Patient meets Critical Trauma Patient Criteria - “Physiologic” or “Anatomic” - transport to the closest most appropriate designated trauma center

4. BASE CONTACT - Base Physician contact is required:
   4.1 If the patient meets “Burn Patient Criteria” (2.1 - 2.6) but the paramedic is requesting transport to a basic ED
   4.2 During an MCI if more than 2 critical burn patients are being transported to a burn center to verify bed availability
   4.3 If the patient requires medical treatment not covered in policy
   4.4 Any time patient care would benefit from consultation with the Base Physician
5. **OUT-OF-COUNTY TRANSPORT**

5.1 Transporting medic **must** first contact out-of-county hospital to confirm bed availability. This can be done through the appropriate dispatch center or via land-line from the field.

5.2 Contact the Base Physician if medical consultation is needed.

5.3 Consider EMS Aircraft transport for land transport times greater than 45 minutes.

5.4 Give a brief report to the receiving facility including ETA.

**Out-Of County Burn Centers:**

Abbreviations: AED, automated external defibrillator; AP, anterior-posterior; CPR, cardiopulmonary resuscitation; HCP, healthcare provider

*Excluding the newly born, in whom the etiology of an arrest is nearly always asphyxial
CARDIOPULMONARY RESUSCITATION (CPR)

ADDITIONAL INFORMATION:
1. Minimize interruptions in chest compressions
2. Use a mechanical compression device whenever possible
   2.1 Refer to manufacturer’s instructions for specific information regarding mechanical CPR device
   2.2 Upon ROSC, you must discontinue mechanical CPR device AND ResQPOD®
3. Defer advanced airway insertion rather than interrupt chest compressions. Do not interrupt chest compressions to place an advanced airway. If after 2 minutes of continuous chest compressions with BVM support an immediate endotracheal airway can not be obtained, consider use of supraglottic airway
4. Emphasis is on high quality, uninterrupted CPR - "push hard and fast" – allow for complete recoil
5. Two minutes CPR between drug doses
6. Once an advanced airway is established, give continuous chest compression without pauses for breaths. Avoid hyperventilation
7. Check rhythm q 2 minutes
8. Defibrillation: Device specific. While both monophasic and biphasic wave form defibrillators are acceptable, biphasic is preferred. Energy level is dependant upon the manufacturer
9. Newborn: Unresponsive, not breathing but has a pulse: 40-60 ventilations/minute. Compression/ventilation ratio: 3:1 (90 compressions : 30 ventilations per minute)
10. Unresolved or persistent arrest, look for and treat:
    - Hypovolemia
    - Hypoxia or ventilation problem
    - Hydrogen Ion (acidosis)
    - Hypo/Hyperkalemia
    - Hypoglycemia
    - Hypothermia
    - Toxins
    - Tamponade (cardiac)
    - Tension pneumothorax
    - Thrombosis (coronary/pulmonary)
    - Trauma (hypovolemia or ICP)
11. If patient regains ROSC, refer to Return of Spontaneous Circulation - ROSC (see page 48)

MECHANICAL CPR DEVICES:
12. PURPOSE: Effective and uninterrupted compressions are important for survival; AHA/ERC Guidelines for CPR (Cardio-Pulmonary Resuscitation) 2005 emphasize the significance of compressions to provide critical blood flow to vital organs and in the end to increase the chances of a successful survival. Mechanical CPR allows for consistent, quality CPR that enables caregivers to focus on other aspects of resuscitation while maximizing effectiveness of therapeutic interventions
13. Indications:
   - Use mechanical CPR devices wherever manual CPR is indicated
   - IMPORTANT NOTE: If ROSC is obtained, mechanical CPR device must be discontinued
14. Contraindications:
   - Refer to manufacturer’s documentation
15. Approved Devices:
   - Both the AutoPulse® and LUCAS™ devices are approved for use in Alameda County. You are required to be trained by your agency in the use of the mechanical CPR device your agency employs
CARDIOPULMONARY RESUSCITATION (CPR)

PIT CREW ROLES:
The roles and responsibilities detailed below are guidelines. There may be fewer personnel on hand for these roles. It is important that there is always a Pit Crew Leader (similar to an Incident Commander on a scene of any MCI). This concept is known as ‘The Pit Crew’ concept and is the standard of care for resuscitations in Alameda County. The roles are as follows:

<table>
<thead>
<tr>
<th>Position and Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pit Crew Leader:</strong></td>
</tr>
<tr>
<td>• Overall team leader</td>
</tr>
<tr>
<td>• Assigns roles</td>
</tr>
<tr>
<td>• Monitors time intervals (2 min. CPR, drug intervals, etc.)</td>
</tr>
<tr>
<td>• Assures quality of CPR</td>
</tr>
<tr>
<td>• Assures use of proper equipment and adjuncts (e.g., EtCO₂)</td>
</tr>
<tr>
<td>• Serves as scribe (field notes)</td>
</tr>
<tr>
<td>• Supervises and assigns crowd control</td>
</tr>
<tr>
<td>• Supervises DNR/POLST issues</td>
</tr>
<tr>
<td>• Performs NO patient care</td>
</tr>
<tr>
<td>• Responsible for overall conduct of resuscitation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Airway Leader:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Performs appropriate airway techniques, procedures</td>
</tr>
<tr>
<td>• Supervises airway decisions</td>
</tr>
<tr>
<td>• Uses confirmatory adjuncts</td>
</tr>
<tr>
<td>• Completes PCR at hospital (if appropriate) (with med leader)</td>
</tr>
<tr>
<td>• Communicates with law/family as needed</td>
</tr>
<tr>
<td>• Defibrillates if medication leader not available</td>
</tr>
<tr>
<td>• Inserts advanced airway (see page 119) * (NOTE: Do not interrupt chest compressions to place an advanced airway)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Medication Leader:</strong></th>
</tr>

</tbody>
</table>

* Indicates vital task to be completed
CRUSH INJURY SYNDROME

Definition: Crush injury syndrome is the name given to the systemic manifestations of muscle crush injury and cell death. Crush injury syndrome should be suspected in patients with certain patterns of injury. Most patients in whom the syndrome develops have an extensive area of involvement such as a lower extremity and/or pelvis. It requires more involvement than just one hand or foot. The syndrome may develop after one hour in a severe crush situation, but usually requires 4 – 6 hours of compression for the processes that cause crush injury syndrome to occur.

Immediate care of crush injury patient (prior to release)

- Cardiac Monitor
- 12 Lead EKG
- Albuterol 10-20 mg via nebulizer
- Fluid resuscitation 20 ml/kg NS
- Pain Management – see pain management policy
  
  Adult: page 43
  Pediatric: page 68
  Use caution if other major traumatic injuries are suspected

Care of crush injury patient after release of compression

- Calcium Chloride 1 gm slow IVP (over 2 min.) Note: flush IV tubing after administering CaCl to avoid precipitation
- Sodium Bicarbonate 1 mEq/kg IVP over 60 seconds

Note: make sure to have a second IV line as other medications may not be compatible.

Hyperkalemia suspected? (see note)

- Yes
- Reassess as needed

- No

Note: entrapment more than 4 hours and/or abnormal EKG findings – peaked “T” wave, absent “P” waves and widened “QRS”
EXTREMITY INJURY

1. ASSESSMENT:
   1.1 Routine Medical Care
   1.2 Document mechanism of injury
   1.3 Document past medical history including history of previous injuries
   1.4 Check for deformity, open wounds, swelling, shortening, and/or rotation
   1.5 Document range of motion, pulses, sensation, and color of the extremity
   1.6 Assess severity of pain (1-10 scale)
   1.7 Assess for other associated injuries

2. GENERAL CARE: (all patients)
   2.1 Control any external bleeding with direct pressure
   2.2 Elevate and apply cold packs
   2.3 Splint injured extremity. Hand injuries should be positioned in the “safe position”
   2.4 Cover open wounds with sterile dressings
   2.5 Provide Pain control – see Pain Management page 43 (Adult) or page 68 (Pediatric)
   2.6 Remove rings or other possibly constricting items

3. FRACTURE/DISLOCATION:
   3.1 If the extremity is pulseless, attempt to place it in normal anatomic position by gentle in-line traction
   3.2 If repositioning does not restore circulation, do not manipulate further, transport immediately.
   3.3 Start IV NS in uninjured extremity

4. AMPUTATION:
   4.1 Place amputated part in dry, sterile dressing, place in sealed plastic bag, and place on top of ice or cold packs (do not place part directly in ice - prevent frostbite)
   4.2 Start IV of NS in uninjured extremity
   4.3 If hypotensive (SBP < 90 or signs of poor perfusion), give fluid challenge (500 mL NS, reassess and repeat if indicated)

5. HIGH-PRESSURE INJECTION INJURY:
   5.1 Compressed air injuries, although they may initially look innocuous require immediate transport, especially if paint, paint thinner or grease is involved. These wounds must be debrided in the operating room as soon as possible to prevent further damage and/or amputation

6. SNAKE BITE:
   6.1 Gently wash the area with cool, wet cloth
   6.2 Avoid constricting bands
   6.3 Do not elevate
Hyperkalemia in the context of dialysis

**Definition:** Hyperkalemia is common in patients with end-stage renal disease, and may result in serious electrocardiographic abnormalities. Dialysis is the definitive treatment of hyperkalemia in these patients. EKG findings are critical to proper treatment decisions. Findings such as peaked "T" waves and absent "P" waves as well as widening QRS complexes are signs that a renal patient in the context of dialysis is suffering from hyperkalemia. Renal patients who are taking ACE inhibitors, ARBs (angiotensin receptor blockers), NSAIDS, beta blockers and/or sodium channel blockers have an increased risk of hyperkalemia in the context of dialysis. Obtain a thorough history paying special attention to the patient’s medications. In the peri-arrest dialysis patient, correcting hyperkalemia can be vital in the patient’s overall survival.

**Care of a dialysis patient with suspected hyperkalemia**

- **Cardiac Monitor**
- **12 Lead EKG**

**Serious Signs & Symptoms:**
- Altered level of consciousness
- Peaked "T" waves, absent "P" waves, and widened QRS complexes (on EKG)

**Yes**
- **Calcium Chloride** 1 gm slow IVP (over 2 min.) *Note: flush IV tubing after administering CaCl to avoid precipitation*
- **Sodium Bicarbonate** 1 mEq/kg IVP over 60 seconds

*Note: make sure to have a second IV line as other medications may not be compatible.*

**No**
- Reassess as needed

**Base Physician order**
HYPERTHERMIA / HEAT ILLNESS

1. SIGNS AND SYMPTOMS OF A HEAT EMERGENCY
   - Weakness or exhaustion
   - Dizziness
   - Headache
   - Sweating may or may not be present
   - Fainting or feeling faint
   - Rapid heart rate
   - Muscle cramps
   - Altered mental status (coma, seizures, delirium)

2. PREEXISTING CONDITIONS THAT CAN CONTRIBUTE TO A HEAT EMERGENCY:
   - Psychiatric disorder (both because of the medications taken and perhaps the patient's poor judgement)
   - Heart disease
   - Diabetes
   - Alcohol

3. TREATMENT:
   3.1 If the patient is conscious:
      3.1.1 Remove patient from hot environment
      3.1.2 Loosen or remove clothing
      3.1.3 Place in supine position with legs elevated
      3.1.4 Administer O₂
      3.1.5 Fan the patient
      3.1.6 Water may be given if patient is alert, has a gag reflex, and is not nauseated
   3.2 If altered mental status is present: (see above)
      3.2.1 Place on left side and monitor airway
      3.2.2 Wet the skin and fan aggressively
      3.2.3 Apply cold packs to the axillae, groin and neck (if available)
      3.2.4 Administer IV fluid challenge (250-500 mL NS)
      3.2.5 Transport immediately

• Routine Medical Care
• Protect patient from environment.
• If the patient is in extremis, begin treatment prior to secondary survey.
• Consider: the environment, patient age, and pre-existing conditions
1. **INTRODUCTION:** Hypothermia is a reduced core temperature where the cold challenge overwhelms heat production and heat retention factors. The rate of onset can be:
   1.1 **Acute** (minutes to hours) e.g. immersion in cold water
   1.2 **Sub-acute** (hours)
   1.3 **Chronic** (often over several days) Homeless, drug users, alcoholics, and compromised individuals are at high risk. Elderly persons and those taking certain medicines are also at risk. Injured and seriously ill individuals can become hypothermic quickly

   ➔ **Note:** a hypothermic critical trauma patient has a very high mortality and morbidity rate!

2. **SIGNS AND SYMPTOMS OF HYPOTHERMIA:**
   2.1 Altered mental status including: confusion, mood changes, and speech difficulties. The patient’s judgment may be affecting causing him/her to exhibit inappropriate behaviors such as removing clothing
   2.2 Decreased motor function, poor coordination
   2.3 Diminished sense of cold sensation
   2.4 Pupils that respond slowly or sluggishly

3. **TREATMENT:**
   3.1 **General:**
      3.1.1 Remove the patient from the cold environment and prevent further heat loss
      3.1.2 Remove wet clothing, begin rewarming - cover with blankets, turn up the heat in the ambulance
      3.1.3 Do not let the patient walk or exert him/herself
      3.1.4 Administer O₂ - titrate to 94-99% SpO₂ (warmed and humidified is preferred)
      3.1.5 Closely monitor cardiac rhythm
      3.1.6 Check blood glucose levels. Administer glucose as needed (see ALOC page 35 – adult or page 64 - pediatric)
      3.1.7 Transport immediately
   3.2 **BLS:**
      3.2.1 CPR should be initiated if there is any doubt about pulselessness
      3.2.2 Severely hypothermic patients may appear dead. If you find an unresponsive, hypothermic patient, take time (30-45 seconds) to try and find a pulse before beginning CPR. Chest compressions should be avoided if any signs of life are present
      3.2.3 If VT or VF is present, defibrillation should be attempted. If one shock is unsuccessful, subsequent shocks should be deferred
HYPOTHERMIA

3.3 **ALS:**

3.3.1 Give fluid challenge with heated N.S. if possible

3.3.2 Do not delay urgent procedures (IV lines and intubation) but perform them “gently.” The severely cold heart is sensitive to a variety of stimuli, and fatal dysrhythmias can be caused by forceful treatment efforts

3.3.3 Defer ACLS medications until rewarming occurs (> 30° C / 86° F)
1. **RATIONALE:** The following information is designed to protect EMS personnel during transport

1.1 Follow standard and universal precautions (gloves, P100 and/or N-95 mask, eye protection) when transporting symptomatic patients. Use a gown if splash is possible.

1.2 If any influenza-like illness is in the community, place a procedure or surgical mask on the patient to contain droplets. If this is not possible (e.g.: a mask would further compromise respiratory status or too difficult for the patient to wear), have the patient cover his/her mouth/nose with a tissue when coughing or sneezing or use the most practical alternative to contain respiratory secretions.

1.3 Unless medically necessary to support life, avoid aerosol generating procedures (e.g., mechanical ventilation). Metered dose inhalers with spacers may be used to deliver albuterol and/or ipratropium if available. If you are performing an aerosol generating procedure on a person with a suspected infectious disease, you are required to wear a P-100 respirator during the procedure(s) and during transport.

1.4 Optimize the vehicle’s ventilation to increase the volume of air exchange during transport.

1.5 Follow standard operating procedures for routine cleaning of the emergency vehicle and reusable patient care equipment.

1.6 **Special considerations for possible novel influenza A:** If patient has influenza-like signs and symptoms with a documented fever, notify receiving facility.

### SUSPECTED SWINE (H1N1) INFLUENZA A

Close contact to confirmed/suspect case(s) AND one or more of the following:

- Attendance at a school, event or workplace that was closed due to H1N1 activity
- Documented fever > 38°C (100.4°F)
- Acute febrile respiratory illness
- Nasal congestion
- Rhinorrhea
- Sore throat or cough
OB/GYN EMERGENCIES

- **Routine Medical Care**
- **Level of distress:**
  - Estimate blood loss (if any)
  - Is the patient in shock? If yes, Go to page 54 “Shock” protocol
- **Consider immediate transport or prepare for delivery**
- **Determine stage (trimester) of pregnancy**

1. **VAGINAL BLEEDING** (Abnormal bleeding between menses, during pregnancy, postpartum or postoperative)
   - 1.1 If postpartum, gently massage the fundus to decrease bleeding
   - 1.2 Monitor vital signs frequently

2. **SPONTANEOUS ABORTION**
   - 2.1 If fetus is > 20 weeks or 500 grams, see neonatal resuscitation protocol (page 67). If non-viable, save and transport any tissue or fetal remains
   - 2.2 Have patient place a sanitary napkin or bulky dressing material over vaginal opening - **Do not pack the vagina with anything**

3. **SEVERE PRE-ECLAMPSIA / ECLAMPSIA**
   - 3.1 Attempt to maintain a quiet environment
   - 3.2 Monitor vital signs frequently
   - 3.3 Observe for seizures, hypertension or coma. If seizures occur, go to the appropriate seizure policy

4. **BREECH DELIVERY**
   - 4.1 Allow delivery to proceed passively until the baby’s waist appears. Gently rotate the baby to a face down position and continue with the delivery
   - 4.2 If the head does not readily deliver insert a gloved hand into the vagina to relieve pressure on the cord and create an air passage for the infant. Transport. Monitor vital signs and infant condition frequently

5. **PROLAPSED CORD**
   - 5.1 Place the mother supine position with head lower than hips
   - 5.2 Insert a gloved hand into the vagina and gently push the presenting part (e.g.: the neonate’s head or shoulder off the cord. **DO NOT TUG ON THE CORD**
   - 5.3 Place fingers on each side of the neonate’s nose and mouth, split fingers into a “V” to create an opening. **Do not** attempt to re-position the cord. **Do not** remove your hand. Cover the exposed cord with saline soaked gauze

6. **LIMB PRESENTATION**
   - 6.1 Defined as the presentation of a single limb - arm or leg
   - 6.2 It is unlikely that the baby will deliver and immediate transport should be initiated
   - 6.3 Place the mother supine position with head lower than hips

---

**OB/GYN EMERGENCIES** 19
1. **Local Optional Scope of Practice** – requires authorization from State EMS Authority
   
   1.1 **ALS PERSONNEL:**
   
   1.1.1 Amiodarone
   1.1.2 Intraosseous infusion
   1.1.3 Pediatric intubation
   1.1.4 Transcutaneous pacing
   1.1.5 Nerve agent exposure drugs:
      - Autoinjectors - for self-administration
      - Pralidoxime chloride (2-PAM) – (patient administration, HazMat trained paramedics only)
      - Atropine – (patient administration, HazMat trained paramedics only)
   1.1.6 Sodium Thiosulfate
   1.1.7 Zofran

2. **Approved for use in Alameda County** – requires additional training
   
   2.1 **ALS PERSONNEL:**
   
   2.1.1 Pulse-oximetry
   2.1.2 Length-based resuscitation tape
   2.1.3 Meconium aspirator
   2.1.4 End-tidal CO₂ detection (colorimetric or capnographic technologies)
   2.1.5 12-lead EKG – optional for first responder agencies
   2.1.6 King-LTD supraglottic airway device
   2.1.7 Continuous Positive Airway Pressure (CPAP)
   2.1.8 Intranasal naloxone and midazolam
   2.1.9 Intraosseous Infusion – Adult and Pediatric

   2.2 **BLS PERSONNEL:** (see “Advanced Airway Management” page 119)
   
   2.2.1 King-LTD supraglottic airway device - optional
   2.2.2 If using King-LTD:
      - End-tidal CO₂ detection (colorimetric or capnographic technologies)

3. Field personnel will not perform any skill that is not a part of his/her scope of practice or has not been authorized by the Alameda County Health Officer and/or EMS Medical Director

4. During an inter-facility transfer or during a mutual aid response into another jurisdiction, a paramedic may utilize the scope of practice for which he/she is trained and accredited

5. Paramedics will not draw blood unless approved in advance by the EMS Medical Director

6. Field personnel are prohibited from carrying any medical equipment or medications that have not been authorized for prehospital use by the Alameda County EMS Medical Director
• Routine Medical Care

• Symptoms of Carbon Monoxide (CO) poisoning:
  ➔ Initial symptoms are similar to the flu with no fever and can include dizziness, severe headaches, nausea, sleepiness, fatigue/weakness and disorientation/confusion

• Note: Carbon Monoxide is a colorless, odorless and tasteless poisonous gas that can be fatal when inhaled. CO inhibits the blood’s capacity to carry oxygen. CO can be produced when burning any fuel. CO is a by-product of incomplete combustion. Suspect CO in the presence of any fire. SpCO = carboxyhemoglobin

1. Pulse oximetry values may be unreliable in SI patients
2. Cyanide and/or the combination of cyanide and carbon monoxide may be responsible for the majority of SI deaths
3. SI should be particularly suspected in patients rescued from closed-space structure fires
4. Sodium thiosulfate should not be given prophylactically
5. Remove victim from the source of exposure
   5.1 Completely remove victim’s clothing prior to transport
   5.2 Perform Spinal Motion Restriction (SMR) if indicated
   5.3 Evaluate patient for facial burns, hoarseness, black sputum, and soot in the nose or mouth
   5.4 Monitor SpCO (if available)
   5.5 Assess and treat for traumatic and/or thermal injuries (go to appropriate policy)
6. Administer 100% oxygen via NRB
   6.1 Control airway early. Perform endotracheal intubation / King LTD placement if indicated
   6.2 Use BVM with airway adjuncts
   6.3 If bronchospasm present, go to appropriate respiratory policy
7. Provide cardiopulmonary support (go to appropriate cardiac arrest policy, if indicated)
8. Initiate IV NS. Consider fluid bolus 250-500 ml
9. ONLY if the patient exhibits serious signs and symptoms of smoke inhalation (SI)
   9.1 Administer sodium thiosulfate IV slowly over 10 minutes
      9.1.1 (Adults: 12.5 g/50 ml | Children: 0.4 g/kg - to a maximum 12.5 g) to SI patients with any of the following signs of cyanide poisoning:
         ➔ Unconsciousness, non-responsiveness
         ➔ Hypotension
         ➔ Severe altered level of consciousness with soot in the mouth or nose
10. Treatment of cyanide poisoning must include immediate attention to airway patency, adequacy of oxygenation and hydration, cardiovascular support, and management of any seizure activity
11. If seizures present, go to appropriate seizure policy
12. If cardiac arrhythmia present, go to appropriate arrhythmia policy
13. Ensure rapid transport

SMOKE INHALATION / CO MONITORING
SMOKE INHALATION / CO MONITORING

Remove victim from source of exposure

Does patient show serious signs and symptoms of smoke inhalation?*

Yes

Maintain airway and adequate respirations.

Oxygen
IV/IO NS
Administer Sodium Thiosulfate 12.5 g/ 50 ml over 10 minutes

No

Measure SpCO (if available)

SpCO >25% or >15% if pregnant? Loss of consciousness? Neurologic impairment?

SpCO 3-25%

Yes

Transport on 100% O2
Consider CPAP

No

Transport on 100% O2 for ED evaluation

Yes

No

No further CO measurement required

*Signs and symptoms of smoke inhalation:
✓ Unconsciousness, non-responsiveness
✓ Hypotension
✓ Severely altered level of consciousness with soot in the mouth or nose

NOTE: If unexplained shock/hypotension develops, consider concomitant CO and/or cyanide poisoning

Sodium Thiosulfate 12.5 grams over 10 minutes
1. **GENERAL TRANSPORT GUIDELINES:** All patients who wish to be transported by ambulance to the hospital should be transported

1.1 **Patient Destination:**

1.1.1 Patients should be transported to the closest hospital appropriate for their medical needs within a reasonable transport time or as specified in the patient care protocols.

1.1.2 In general, patients should be transported to the hospital choice of the patient and/or family, if allowed by the protocols, and if there is no compelling reason to take them somewhere else.

1.1.3 Paramedics should contact the Base Physician for any questions regarding transport destinations. If the Base Hospital is contacted for medical direction, the ultimate responsibility for determining patient destination will rest with the Base Hospital Physician.

2. **TRANSPORT DECISIONS:** Transport decision should be based on paramedic judgment. Paramedics should take the following into consideration before transport:

2.1 Patient condition or ability of field personnel to provide field stabilization and/or emergency intervention. **TRANSPORT OF ACUTE PATIENTS:** Any patient with an acute, unstable appearance and/or severe symptoms may be transported Code 3 (lights and siren). **Code 3 transport (lights and siren) has significant, inherent risks for the public and the patient.** If Code 3 transport of an acute patient does NOT significantly decrease transport time to the hospital, the acute patient **should be transported Code 2 (no lights and siren).** The hospital must be notified of the patient's Code 3 acuity even if transported Code 2.

2.2 Scene assessment and/or potential extrication difficulties.

2.3 ETA to the destination facility including traffic delays.

2.4 Instructions within specific algorithms to “initiate early transport”.

2.5 Hospital diversion status - See “Ambulance Diversion” page v.

2.6 Recommendation from a physician familiar with the patient’s current condition, or the patient’s regular source of hospitalization/healthcare. For physician on-scene - see page 108.

2.7 Hospitals with specialized services (e.g.: trauma center, burn center, STEMI Center (SRC), etc.)

3. **TRANSFER OF CARE:** Any paramedic level personnel may transfer care of a BLS patient to any EMT-I as long as the care required by the patient is within the scope of practice of an EMT-I, and the patient has no injury or illness that requires or is likely to require monitoring or treatment by an ALS provider.

4. **RECEIVING HOSPITAL NOTIFICATION:** Transport units should contact the receiving hospital prior to arrival with the patient’s chief complaint, a summary of treatment given and the ETA.

5. **OUT OF COUNTY TRANSPORTS:**

5.1 Patients may be transported to hospitals outside Alameda County if the out-of-county hospital is the closest most appropriate hospital for the medical needs of the patient. Base contact is not required but should be attempted if there are any questions regarding the transport.

5.2 Contact the receiving facility by radio or landline. If unable, contact the appropriate dispatch agency to relay information to the receiving facility. This will provide information on bed availability. Do not transport patient to out-of-county hospital without obtaining prior authorization.
TRAUMA PATIENT CARE

• Routine Medical Care
• Transport Decision - Determine need for rapid intervention/transport
• Critical Interventions - Done prior to and/or during transport
  ➤ Secure airway
  ➤ Assure adequate breathing, i.e., occlusive dressing, pleural decompression
  ➤ Control life-threatening bleeding (use a tourniquet if extremity bleeding is uncontrollable see page 130)
• Transport
• If traumatic arrest is suspected do not use ACLS medications

STABILIZE THE PATIENT
➤ Control major external hemorrhage (see page 130)
➤ Control the Airway - Consider endotracheal intubation or supraglottic airway device if indicated
(See below for patients with closed head trauma)
➤ Determine patient severity (see “Trauma Patient Criteria” - see page 25):

<table>
<thead>
<tr>
<th>Meets Physiologic and/or Anatomic Factors</th>
<th>Meets Mechanism of Injury Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>➤ Transport to the Trauma Center In accordance with Transport Guidelines (page 22).</td>
<td>➤ Transport to the Trauma Center code 2.</td>
</tr>
<tr>
<td>➤ ADULT - Establish one (1) large bore IV/IO with Normal Saline (NS) or Saline Lock (SL). Establish 2nd IV if appropriate.</td>
<td>➤ ADULT/PEDIATRIC - Establish one (1) large bore IV/IO with Normal Saline (NS) or Saline Lock (SL).</td>
</tr>
<tr>
<td>➤ PEDIATRIC- Establish one (1) appropriate large bore IV/IO with Normal Saline (NS) or Saline Lock (SL).</td>
<td></td>
</tr>
</tbody>
</table>

Do NOT delay transport to establish IV/IO access
See “Trauma Patient Criteria” (page 25) for additional judgment decisions on code 2 transports

➤ Consider spinal motion restriction (SMR) for blunt trauma (see page 140)
➤ Administer Oxygen - Titrate SpO₂ to 94-99%
➤ IV fluid resuscitation:
  ➤ SBP < 90 mmHg, NS IV/IO 250 – 500ml bolus
  ➤ > 90 mmHg, IV/IO TKO or Saline Lock
  ➤ Reassess BP q 5 minutes
➤ Consider TXA for patients with signs of shock or uncontrolled bleeding (see page 28)
➤ Care of the patient with a closed head injury (GCS < 8):
  ➤ Advanced airway (ETT or King-LTD)
  ➤ End-tidal CO₂ should be between 30-35 mmHg
  ➤ Track respiration or ventilate to a rate of approx 12 times/minute with 100% O₂
    (AVOID HYPERVENTILATION)
  ➤ IV/IO NS in 500 mL increments to maintain mean arterial pressure (MAP) of at least 80 mmHg. Reassess BP q 5 minutes

IMPORTANT CONSIDERATIONS
➤ Contact the Base Hospital, if appropriate
➤ Contact the Trauma Center, as soon as possible
➤ Consider pain management when appropriate
➤ Splint fractures and dress wounds ONLY if time permits

FORMULA FOR ESTIMATING MAP
MAP = diastolic + (systolic - diastolic) / 3
1. **INTRODUCTION:** The goal of the Alameda County trauma system is to transport confirmed Critical Trauma Patient(s) (CTP) or, potential CTPs who might benefit from care at a trauma center directly to a designated Trauma Center in a timely manner, bypassing non-trauma centers.

2. **CRITICAL TRAUMA PATIENT CRITERIA**
   2.1 A patient is identified as a CTP when any of the following physiologic and/or anatomic factors are present. These patients should be transported code 3.

   2.2 **Physiologic criteria:**
   - Glasgow Coma Scale ≤ 13 or;
   - Blood pressure < 90 systolic or;
   - Respiratory rate < 10 or > 29 (< 20 in infant < one year) or need for ventilatory support

   2.3 **Anatomic injury factors:**
   - Penetrating injury to the torso, head, neck, groin, or extremity proximal to the knee or elbow
   - Flail chest
   - Evidence of two or more proximal long bone fractures (femur, humerus)
   - Crushed, degloved, mangled, or pulseless extremity
   - Traumatic amputation above the wrist or ankle
   - Evidence of pelvic fracture
   - Open or depressed skull fracture
   - Traumatic paralysis

3. **MECHANISM OF INJURY:** In addition to CTP criteria, the following mechanisms of injury may be used to identify a CTP. In general, these patients are transported code 2, however, differing field circumstances and/or patient condition may require a code 3 transport.

   3.1 **Falls**
   - Falls greater than twenty (20) feet
   - Falls greater than ten (10) feet (<14 or ≥55 years of age)

   3.2 **High-risk auto crash**
   - Intrusion including roof; > 12 in. occupant site; > 18 in. any site
   - Ejection of patient (partial or complete) from a moving object (automobile, motorcycle, scooter, horse, etc.)
   - Death of an occupant in the same passenger space
   - Vehicle telemetry data consistent with high risk of injury

   3.3 **Auto vs. pedestrian/bicyclist thrown, run over, or with significant (> 20 mph) impact**

   3.4 **Motorcycle crash > 20 mph**

   3.5 **Suspected closed head injury**
4. **SPECIAL PATIENT CONSIDERATIONS:** Patients with the following considerations should be considered for transport to a trauma center. **It is highly recommended that you make base contact in these situations**

4.1 **Age**
4.1.1 Older adults

- Risk of injury and/or death increases after age 55
- SBP <110 may represent shock after age 65
- Low impact mechanisms (e.g. ground level falls) may result in severe injury

4.1.2 Children (≤ 14 Years of age)

- should be triaged preferentially to a pediatric-capable trauma center (e.g.- Children’s)

4.2 **Anticoagulation and bleeding disorders**

- Patients with head injury are at high risk for rapid deterioration

4.3 **Burns**

- Without other trauma mechanism: *Triage to burn center*
- With trauma mechanism: *Triage to trauma center*

4.4 **Pregnancy > 20 weeks**

4.5 **EMS provider judgement**

5. **TRANSPORT:** Patients identified as a CTP will be transported to the closest, most appropriate, designated Trauma Center. **Exception:** The patient is identified as a CTP or Potential CTP but presents with one of the following:

<table>
<thead>
<tr>
<th>PATIENT PRESENTATION</th>
<th>ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>UNMANAGEABLE AIRWAY:</strong> <em>The patient requires intubation, and the paramedic is unable to intubate, and an adequate airway cannot be maintained with B.V.M. device.</em></td>
<td>Closest Basic E.D.</td>
</tr>
</tbody>
</table>
| **ADULT TRAUMA ARREST - BLUNT or PENETRATING:** | **Determination of Death in the Field (page 88)**
Note: Coroner’s personnel must transport all dead bodies. If ordered to move a body by law enforcement, note the time, name, and badge number of the officer, and comply with the request. Ensure that the police officer on scene has contacted the Coroner’s Bureau for permission to move the body |
| **PEDIATRIC TRAUMA ARREST BLUNT or PENETRATING:** | ➔ ETA to the Pediatric Trauma Center ≤ 20 minutes | Pediatric Trauma Center |
| | ➔ ETA to the Pediatric Trauma Center ≥ 20 minutes | Closest Adult Trauma Center |
6. **TRAUMA BASE CONTACT:** Varying field circumstances make rigid application of any set of rules impractical. These criteria should serve as guidelines. Clinical circumstances may dictate that transport be undertaken immediately with Trauma Base contact made en route

6.1 **Designated trauma base hospital** - Highland Hospital is the Base Station for all trauma patients requiring base contact

6.2 **Trauma base contact is not required** if the patient meets "Critical Patient Criteria" or "Mechanism of Injury" and is transported to a Trauma Center

6.3 If the patient meets any of the "Special Patient Considerations" and Trauma Base contact cannot be established or maintained, transport the patient to a Trauma Center

6.4 **Contact the trauma Base Physician if:**
   - The patient meets the criteria listed in the "Mechanism of Injury" criteria but the paramedic is requesting transport to a basic ED
   - The patient requires medical treatment not covered in the "Trauma Patient Care" protocol (see page 24)
   - The patient would benefit from consultation with the Base Physician

7. **OUT-OF-COUNTY TRANSPORT**

7.1 Patients who meet "Trauma Patient Criteria" may be transported directly to an out of county Trauma Center

7.2 Prior to transporting to an out-of-county Trauma Center, the transporting medic must:
   - Contact the out-of-county Trauma Center by landline to determine if they can accept the patient
   - Give a brief report including E.T.A.
   - Contact the Alameda County Base Hospital if medical consultation is required (see #6 above)

7.3 **Out-of-County Trauma Centers:**

1. **DESCRIPTION** - Tranexamic Acid (TXA) is a Lysine analogue that works to inhibit the formation of plasmin, which is a molecule responsible for clot degradation. It has had multiple medical applications in the past including pre-operative use, menorrhagia, hemophilia and hereditary angioedema. It has recently been shown in multiple studies to reduce mortality in trauma patients meeting specific physiologic criteria or who have obvious signs of massive hemorrhage.

2. **INDICATIONS** - The prehospital use of TXA should be considered for all trauma patients that meet any of the following criteria:
   2.1 Any sustained blunt or penetrating trauma within three (3) hours with either:
      2.1.1 Blunt or penetrating trauma with signs and symptoms of hemorrhagic shock.
         ➔ Systolic blood pressure of less than 90 mmHg at scene of injury, during ground medical transport, or on arrival to designated trauma centers.
      2.1.2 Patients who are considered to be high risk for significant hemorrhage:
         ➔ Estimated blood loss (EBL) of 500 milliliters in the field accompanied with heart rate (HR) greater than 120.
         ➔ Bleeding not controlled by direct pressure or tourniquet.
         ➔ Major amputation of any extremity above the wrists or above the ankles.

3. **CONTRAINDICATIONS**
   ▶ Any patient under 18 years of age.
   ▶ Any patient with an active thromboembolic event (within the last 24 hours), i.e., active stroke, myocardial infarction or pulmonary embolism.
   ▶ Any patient with a hypersensitivity or anaphylactic reaction to TXA.
   ▶ Any patient more than three (3) hours post injury.
   ▶ Traumatic arrest with greater than five (5) minutes of CPR without return of vital signs.
   ▶ Penetrating cranial injury.
   ▶ Traumatic brain injury with brain matter exposed.
   ▶ Isolated drowning or hanging victims.
   ▶ Documented cervical cord injury with motor deficit.

4. **ADMINISTRATION**
   4.1 Administer TXA 1 gram in 100ml NS or D$_5$W IV/IO over 10 minutes
      *Do NOT administer IV push. This will cause hypotension.*
   4.2 Place an approved wristband on the patient.
   4.3 Follow IV fluid resuscitation guidelines on page 23, “Trauma Patient Care”
5. **DOCUMENTATION REQUIREMENTS** - Documentation on the electronic patient care report (ePCR) must include:

5.1 Meets trauma triage criteria
5.2 Age
5.3 Weight
5.4 Date/time of injury onset of symptoms
5.5 Mechanism of injury
5.6 Initial SBP and vital signs
5.7 EBL: pre and post TXA administration
5.8 Blunt or penetrating trauma location and description of injuries
5.9 Vital signs including Glasgow Coma Scale (GCS) and temperature: pre, during and post TXA administration
5.10 Any fluid administration
5.11 Date/time TXA was started
5.12 Past medical history
5.13 Allergies
5.14 Race/ethnicity
5.15 Gender

1. **PURPOSE:** To identify acute stroke patients who may be candidates for thrombolysis and specialized care at a certified stroke center. Information in this policy is based on the Cincinnati Prehospital Stroke Scale (CPSS). The CPSS evaluates using FASTT criteria (Facial droop, Arm drift, Speech abnormalities, Time of onset/Transport).

2. **Certified Stroke Centers:** The following hospitals have been designated as certified stroke centers. If possible patient should be transported to the patient's regular source of hospitalization and/or healthcare.
   - Alameda Hospital, Alameda
   - Eden Medical Center, Castro Valley
   - Kaiser Hospital, Fremont
   - Kaiser Hospital, Oakland
   - Kaiser Hospital, San Leandro
   - Summit Medical Center, Oakland
   - Washington Hospital, Fremont

   Consider transport to one of the following out-of-county centers, if appropriate. Contact the stroke center prior to transport.
   - San Ramon Medical Center, San Ramon
   - Stanford University Medical Center, Palo Alto
   - John Muir Medical Center, Walnut Creek
   - Kaiser Hospital, Walnut Creek
   - Regional Medical Center, San Jose

3. **Assessment and transport of suspected Acute Stroke patient:**
   - Provide routine medical care including pulse oximetry
   - Obtain blood glucose
   - Assess the patient using the Cincinnati Prehospital Stroke Scale

▶ **Note:** Early transport is essential if CPSS is positive
ACUTE STROKE

**Cincinnati Prehospital Stroke Scale**

<table>
<thead>
<tr>
<th>Sign/Symptom</th>
<th>How Tested</th>
<th>Normal</th>
<th>Abnormal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facial Droop</td>
<td>Have the patient show their teeth or smile</td>
<td>Both sides of the face move equally</td>
<td>One side of the face does not move as well as the other</td>
</tr>
<tr>
<td>Arm Drift</td>
<td>The patient closes their eyes and extends both arms straight out for 10 seconds</td>
<td>Both arms move the same, or both do not move at all.</td>
<td>One arm either does not move, or one arm drifts downward compared to the other.</td>
</tr>
<tr>
<td>Speech</td>
<td>The patient repeats “The sky is blue in Cincinnati”.</td>
<td>The patient says correct words with no slurring of words.</td>
<td>The patient slurs words, says the wrong words, or is unable to speak</td>
</tr>
</tbody>
</table>

**Time of Onset**

Must be within 4 hours, observed by a reliable witness (for thrombolysis)

**Transport**

The patient is considered a possible Acute Stroke patient if any of the tested signs/symptoms are abnormal and must be transported to the closest, most appropriate certified stroke center. If possible patient should be transported to the patient’s regular source of hospitalization and/or healthcare.

4. **The patient may be a candidate for thrombolysis if all of the following are true:**
   - One or more of the CPSS signs/symptoms are present.
   - CPSS signs/symptoms were initially observed within 4 hours of contact by a reliable witness. **Please note:** Ask when the patient was last seen at normal baseline and when the onset of new stroke signs and symptoms appeared.
   - Normal blood glucose level is obtained

**Make sure to either:**

- transport the witness to the stroke center in the ambulance (PREFERRED); OR,
- if driving, tell him/her to leave immediately and meet you at the stroke center; AND,
- obtain a contact number where the witness can be reached by the attending physician

5. **Treatment and support guidelines (to be done en route)**
   - Transport patient in supine position. If this position is not tolerated or there is evidence of increasing intracranial pressure/intracranial hemorrhage, transport in semi fowlers with no more than 30° head elevation
   - O₂ – titrate to 94-99% SpO₂
   - Establish IV access enroute using an 18 gauge (no smaller than 20 gauge) proximal to wrist (AC preferred). No more than 1 AC attempt and no more than 2 IV attempts total. **Maintain with a saline lock or IV infusion set TKO**
   - Obtain a 12-Lead EKG enroute when a dysrhythmia or ACS symptoms are present (specifically watch for STEMI and/or atrial fibrillation)

6. Immediately call the designated stroke center via phone and/or radio and notify them that you are transporting a “possible Acute Stroke patient by the Cincinnati Prehospital Stroke Scale (CPSS), ETA _____ minutes”. **(Reminder: See “Diversion Criteria” or the information on page v of the field manual regarding CT Diversion)**

7. Document the results of the assessment on the PCR and specifically describe any of the CPSS signs and/or symptoms that were abnormal
**AIRWAY OBSTRUCTION**

- **Routine Medical Care**
  - If obstruction due to laryngeal trauma, see page 24 "Trauma Patient Care"
  - Obstruction due to epiglottitis:
    - Do not attempt to visualize the throat or insert anything into the mouth
- Do not use a tongue/jaw lift or perform blind finger sweeps
- **Rapid Transport**

*Sighs of severe obstruction:*
- Poor air exchange
- Increased breathing difficulty
- Silent cough
- Cyanosis
- Inability to speak or breathe
- Ask the patient "Are you choking"?
  If patient nods yes, act

- **Severe signs of obstruction?**
  - Yes
  - Apply abdominal thrusts in rapid sequence. If ineffective, or the patient is obese or in the late stages of pregnancy, consider chest thrusts.
  - No
  - Maintain airway and Oxygen

- **Suspect epiglottitis?**
  - Yes
  - If the patient deteriorates, or becomes completely obstructed, positive pressure ventilation via bag-valve-mask should be attempted first.
  - No
  - Continue abdominal and chest thrusts. If the patient becomes unresponsive:
    - Begin CPR
    - Check mouth for F.B.

- **Position of comfort**
  - If the patient deteriorates, or becomes completely obstructed, positive pressure ventilation via bag-valve-mask should be attempted first.

- **Maintain airway and Oxygen**
  - Yes
  - If airway can not be maintained with BVM
    - Consider: Intubation (see page 119)
  - No

- **Attempt Intubation or Assist Ventilation with Bag-Valve-Mask**
  - Able to ventilate adequately?
    - Yes
    - Maintain airway and Oxygen
    - No
    - Transport to the closest ED
ALTERED LEVEL OF CONSCIOUSNESS

- **Routine Medical Care**
  - Obtain a complete patient history including current medications
  - Identify and document neurological deficits
  - Naloxone **should not** be given as treatment for altered level of consciousness in the absence of respiratory depression (respiratory depression = rate of less than 8 breaths per minute) (see page 46)
- **Note:** Glucose paste may be administered if the patient: 1) is able to hold head upright; 2) has a gag reflex; and, 3) can self-administer the medication
  - Dextrose should **not** be given with suspected Acute Stroke unless blood sugar reading is < 60 mg/dL
  - Perform 12-Lead EKG, as appropriate, and transport to a STEMI Receiving Center if STEMI is identified. (See page 128 - EKG 12-Lead) for STEMI Receiving Center information
  - SMR for trauma or suspicion of trauma (see page 140)

**Contact the Base Physician if:**
- the Blood Glucose reading is > 60 mg/dL but hypoglycemia is suspected

---

**Check blood glucose**

Result: < 60 mg/dL?

- **Yes**
  - **Maintain airway and adequate respirations.**
  - **O₂ – titrate to 94-99% SpO₂**
  - **IV/IO NS**
  - **Dextrose 10%**
    - **First dose**
    - 10g (100 ml) IV/IO
    - or
    - **Glucagon** 1 mg IM
      - (if unable to start IV or IO)
      - or
    - **Oral Glucose** 30 gms
      - insert into oral mucosa
      - (See note above)
  - Recheck blood glucose 5-10 minutes after D10 administration. If the patient’s blood glucose remains < 60 mg/dl
  - Give additional **Dextrose 10%**
    - 15g (150 ml) IV/IO

- **No**
  - **Consider AEIOU – TIPS**

- **Appropriate Response?**
  - **Yes**
  - Reassess as needed
  - **No**
ANAPHYLAXIS / ALLERGIC REACTION

**ANAPHYLAXIS / ALLERGIC REACTION**

• **Epinephrine IM** is the cornerstone of treatment of anaphylaxis and should be given as early as possible. It is best absorbed from an injection in the lateral thigh.
• If the patient is in severe distress, **administer Epinephrine IM** and consider immediate transport.
• **SIGNS OF ANAPHYLAXIS (Systemic Reaction)** – wheezing, repetitive cough, tightness in chest, stridor, difficulty swallowing or tightness in throat, change in voice, dizziness or feeling faint, abdominal complaints (pain, repeated vomiting, diarrhea or incontinence), anxiety, lethargy.
• **SIGNS OF ANAPHYLACTIC SHOCK** – pallor, hypotension, cool, clammy mottled skin, altered sensorium.
• **HIVES/ITCHING or FLUSHED SKIN** often accompanies anaphylaxis, but is not always present.

---

**ANAPHYLAXIS (Systemic Reaction)**

**EPINEPHRINE**

1mg/mL 0.3mg-0.5mg IM**
May Repeat x 1 in 15 min.

**SIGNS OF SHOCK?**

---

**IV/IO NS**
**FLUID BOLUS**
1-2 liters NS
Assist ventilations with BVM as required.

Reassess 5-10 mins. after IM epi. If VS not improved with fluid bolus:
**EPINEPHRINE 0.1mg/mL**
1mL (0.1mg) IV/IO slowly***
• Max single dose 0.1 mg
• May repeat q 10 minutes

If no response
Base Physician consult

---

**OXYGEN**
If Any Distress

**ALLERGIC REACTION**
(Skin or mucous membrane symptoms only without signs of anaphylaxis or airway obstruction)

Consider for Urticaria (Hives/Itching)
**DIPHENHYDRAMINE§**
1 mg/kg IV/IM
up to 50mg

---

**ALBUTEROL**
5 mg in 6 mL NS via hand-held nebulizer, mask, or BVM
Consider for Urticaria (Hives/Itching)
**DIPHENHYDRAMINE§**
1 mg/kg IV/IM
up to 50mg

---

NOTES

* If patient develops signs of anaphylaxis, go to other arm of this algorithm

** In elderly, small, or in patients with mild symptoms or history of CAD, consider lower dose (0.3mg IM).

*** IV/IO epinephrine should only be used if symptoms are unresponsive to IM epinephrine and patient has signs of profound shock.

§ Diphenhydramine may lessen discomfort from rash/itching but is *not an essential treatment of anaphylaxis*. Consider reduced dosage if patient has taken diphenhydramine in the past 1-2 hrs.
ASYSTOLE / PULSELESS ELECTRICAL ACTIVITY

**REVERSIBLE CAUSES**
- Hypovolemia
- Hypoxia
- Hydrogen ions (Acidosis)
- Hypo/ Hyperkalemia
- Hypothermia
- Tablets or Toxins
- Tamponade
- Tension pneumothorax
- Thrombosis (MI, CVA)
- Thromboembolism (PE)

**Routine Medical Care**
- Consider and treat other possible causes – See CPR page 10
- **Note:** Use of a mechanical CPR device is required whenever available and appropriate

**CPR**
(see note above)

**ITD (See page 132)**

**O₂ – High Flow Monitor**

**IV/ IO NS**

**Epinephrine 0.1mg/mL**
1 mg IV/IO
Repeat q 3-5 minutes

2 minutes or 5 cycles of CPR
Check rhythm

**Shockable rhythm?**

Yes

**Go to:**
Return of Spontaneous Circulation
page 48
or
Appropriate Dysrhythmia Policy

No

**Organized Rhythm and pulse present?**

Yes

**Consider:**
^Discontinue CPR
See page 88
or
Continue CPR
Transport

No

**^Discontinuation of CPR:**
If non-shockable rhythm persists, despite appropriate, aggressive ALS interventions for 30 minutes, consider discontinuation of CPR

**Do not interrupt CPR to administer medications or perform airway management**

If renal failure or hyperkalemia suspected:
**Calcium Chloride** 1 gm slow IVP (over 2 min.)
**Note:** flush IV tubing after administering CaCl to avoid precipitation

**Sodium Bicarbonate** 1 mEq/kg IVP
**Note:** make sure to have a second IV line as other medications may not be compatible

**NOTE:**
If after 2 minutes of continuous chest compressions and BVM support an immediate endotracheal airway cannot be obtained, consider use of supraglottic airway

**NOTE:** If after 2 minutes of continuous chest compressions and BVM support an immediate endotracheal airway cannot be obtained, consider use of supraglottic airway

*Place advanced airway*
**BRADYCARDIA**

**• Routine Medical Care**
**• Bradycardia:** < 50 beats/minute, 2nd degree block, 3rd degree block
**• Serious signs and symptoms:**
  - Acute altered mental status
  - Hypotension
  - On-going chest pain
  - Other signs of shock

**• Note:**
  - If utilizing Transcutaneous Pacing (TCP), verify mechanical capture and patient tolerance (see page 145)
  - Use sedation with caution in the hypotensive patient (see page 138)
  - If patient symptomatic and pacing not available, consider rapid transport

<table>
<thead>
<tr>
<th>Transcutaneous Pacing:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin at 80 bpm, 0 mA; increase in 10 mA increments until capture obtained then increase the output level by 10%. (see TCP page 145)</td>
</tr>
<tr>
<td>Consider: Sedation (see note above &amp; sedation policy)</td>
</tr>
<tr>
<td>Consider: Pain Management – titrate to effect</td>
</tr>
</tbody>
</table>

| Consider: Atropine 0.5 mg IV/ IO while waiting for TCP. May repeat q 3-5 minutes to a total dose of 3 mg. |
| Consider: Dopamine 2-10 mcg/kg/min IV/IO, while waiting for TCP or TCP ineffective |

If capture maintained but patient remains symptomatic, consider:
  - Increase rate by 10 bpm to a max of 100 bpm
  - Fluid challenge, particularly if evidence of right ventricular MI

**Signs or symptoms of poor perfusion caused by bradycardia?**

- **Yes**
  - Maintain airway, assist breathing as needed
  - \(O_2\) – titrate to 94-99% \(SpO_2\)
  - Monitor IV/ IO NS
  - Consider 12-lead if stable

- **No**
  - Observe/ Monitor

**If patient is symptomatic, do not delay pacing to start an IV or wait for atropine to take effect.**

**Base Physician consult if patient remains symptomatic**
CHEST PAIN - SUSPECTED CARDIAC/STEMI

**Routine Medical Care**

**Signs of Shock** - 2 or more of the following:
- Pulse > 120/minute
- BP < 90/systolic
- Pale, cool and/or diaphoretic skin signs
- Altered Mental Status

- If cardiac chest pain is suspected and the patient is able to swallow, give **Aspirin 162 - 324 mg** po as soon as possible (tablet or chewable – not enteric coated)
- NTG may be prioritized as needed based on patient presentation
- Perform 12-Lead EKG, as appropriate, and transport to a STEMI Receiving Center if STEMI is identified. See page 128 - EKG 12-Lead for EKG transmission and STEMI Receiving Center information

**Note:** If the patient has taken **erectile dysfunction (ED) medication within the last 24 hours (Viagra/Levitra) or 36 hours (Cialis), withhold nitroglycerin**

---

Patients who have oxygen saturations of greater than 94% without signs or symptoms of hypoxia or impending airway compromise should not receive oxygen.

---

Monitor
Assess ABC’s
O₂ – titrate to 94-99%
**Aspirin 162-324 mg IV/IO NS**

12-lead EKG

* **NTG 0.4 mg** up to 3 doses, q 3-5 minutes for continuing pain/discomfort

If unresponsive to nitrates:
**Pain Management**
(see page 43)

(^^see note)

---

**ST Elevation MI? (STEMI)**

**Yes**

Transmit EKG to STEMI Receiving Center (SRC) (see page 128)

Transport to SRC

Establish 2ⁿᵈ IV en-route

**No**

Do not delay transport if technical difficulties impede EKG transmission. Attempt to send en-route whenever possible.

---

**^Note:** If B/P drops below 90 systolic or drops > 30 mm/Hg from baseline at any point; or, heart rate is < 50 or > 100 bpm, contact the base physician before administering/continuing NTG and/or Pain Management

---

Patients who have oxygen saturations of greater than 94% without signs or symptoms of hypoxia or impending airway compromise should not receive oxygen.

---

* Administer nitrates with extreme caution, if at all, to patients with inferior wall MI and suspected right ventricular involvement, because these patients require adequate RV preload. (Obtain right-sided ECG leads to assist in diagnosing RV infarct.)
**DYSTONIC REACTION**

**• Routine Medical Care**
- History includes ingestion of phenothiazines:
  - Chlorpromazine (Thorazine, Largactil)
  - Promazine (Compazine)
  - Triflupromazine (Vesprin)
- Levomepromazine (Nozinan)
- Piperidines (Haloperidol, Risperidone)
- Promethazine (Phenergan)

**• Signs and Symptoms (often mistaken for a seizure disorder or tetany):**
- Agitated/frightened appearance
- Small pupils
- Hypotension
- Facial grimaces
- Protruding tongue
- Jaw muscle spasm
- Oculogyric crisis (circular movement of the eyeballs)
- Torticollis (twisting of the neck)
- Spasms of the back muscles, causing the head and legs to bend backward and the trunk to arch up

---

**O₂ – titrate to 94-99% SpO₂**
Maintain airway
IV NS

---

**Yes**
Diphenhydramine
1 mg/kg IV, IO or IM
up to 50 mg
If initial dose given IV/IO:
May repeat dose in
15 minutes for continuing
signs/symptoms.

---

**No**
Reassess as needed

---

**Signs and/or symptoms present?**
## MEDICATIONS – AUTHORIZED | STANDARD INITIAL DOSE

<table>
<thead>
<tr>

|                             | 1 - 3 kits depending on exposure (given with atropine)                                |
**PAIN MANAGEMENT**

- **Routine Medical Care**
  - Monitor the patient closely
  - Utilize capnography
- **Have Naloxone readily available.** Fentanyl is a potent, synthetic opiate that is 100 times stronger than morphine. It may take twice as much naloxone to reverse the effects of an overdose.
- **Pain management should be initiated as early as possible and before transport in the stable patient.** Attempts should be made to reduce pain by using psychological coaching and BLS measures such as ice packs and splints. Consider pain management prior to the manipulation of suspected fractures.
- **The preferred route of administration is intravenous (IV).**
- **Document the level of pain prior to and after the administration of fentanyl.**
- **Consider lower doses for older adults (25mcg).**
- **For the first and subsequent doses (all routes), consider 1 mcg/kg as a guideline.**

### Pain Management Criteria

<table>
<thead>
<tr>
<th>Base Contact</th>
<th>Treatment</th>
</tr>
</thead>
</table>
| **Any patient with a complaint of significant pain, including:**
  - Significant extremity injuries
  - Burn patients
  - ACS patients
  - Crush injury patients
  - Prolonged extrication
  - Severe back and spinal pain
  - Immobilized patients
  - Abdominal pain
  - Premedication for patients undergoing invasive or potentially painful procedures | No unless > 200 mcg of fentanyl is needed |
| **Critical Trauma patients with:**
  - Abdominal trauma
  - Thoracic trauma | No unless > 100 mcg fentanyl is needed |
| **Other patients with a complaint of significant pain, including:**
  - Decreased respirations
  - Altered mental status
  - BP < 90 systolic
  - Patients with pain not covered above | Yes | Contact the Base Physician prior to administering any pain medication |

### VISUAL ANALOG SCALE

0 1 2 3 4 5 6 7 8 9 10
No Pain Worst Pain Ever
**Patient Care Policy (Adult)**

**POISONING | INGESTION | OVERDOSE**

**Routine Medical Care**
- Protect Yourself! - See HazMat page 157

**Identify substance** - Bring any containers, labels or a sample (if safe) into the hospital with the patient. Determine type, amount and time of the exposure.

**Consult the Base Physician:**
- If *organophosphate poisoning* suspected*
- If *calcium channel* or *beta blocker OD* suspected*
- For treatment options for specific exposures
  * Consider contacting Poison Control for other substances **800-222-1222**

**Remove contaminated clothing. Brush off powders, wash off liquids with copious amounts H₂O**

- O₂ – titrate to 94-99% SpO₂
  Maintain airway and adequate ventilation
  IV/ IO NS TKO

---

- **Ventilating adequately, alert with a good gag reflex?**
  - Yes
    - If non-acid, non-caustic, non-petroleum consider:
      **Charcoal** 1 gm/kg po
      if within one hour of ingestion
      Max dose of 50 grams
  - No
    - Assist respiration with bag-valve-mask or, Intubate as needed
    - **Fluid Challenge** 500 ml
      if B/P < 90/sys

- **If tricyclic antidepressant suspected** (widened QRS, hypotension unresponsive to fluids) consider:
  **Sodium Bicarbonate** 1 mEq/kg

---

- For late stage seizure complications go to **Seizure page 51**
- For patients with suspected narcotic OD go to Respiratory Depression page 46
**Routine Medical Care**
- It will be necessary to briefly remove the CPAP mask to administer aerosolized/oral medications; this will not harm the patient. Ensure a tight fit is obtained upon mask re-application
- **Consider ASA**, 162 – 324 mg po, for acute coronary syndrome patients
- Perform 12-Lead EKG, and transport to a STEMI Receiving Center if STEMI is identified. (See page 128 - EKG 12-Lead) for STEMI Receiving Center information
- **Rapid transport** if on scene stabilization is unlikely

*Note #1:
Consult the base physician if the B/P drops below 90/ systolic at any point, before continuing NTG, or for any questions regarding dosage

O₂ – titrate to 94-99% SpO₂
IV NS

*B/P > 90 systolic?*

Yes

**NTG** 0.4 mg
q 5 minutes
for continuing symptoms

If the patient's B/P is >150/systolic, double ^NTG to 0.8 mg q 5 minutes.
Maximum total dose: 8.0 mg

Consider: **CPAP page 126**

Reassess as needed

Go to:
Cardiogenic Shock page 54

^ Note #2:
✓ Repeat vital signs between doses.
✓ Only increase **NTG** dose to 0.8 mg while the B/P is ≥ 150/systolic.
✓ If B/P drops below 150/systolic resume 0.4 mg dose.
RESPIRATORY DEPRESSION OR APNEA (SUSPECTED NARCOTIC OD)

- **Routine Medical Care**
- **SAFETY WARNING!** Naloxone will cause acute withdrawal symptoms in patients who are habituated users of narcotics (whether prescribed or from abuse)
- Use of diluted Naloxone IV and titration with small increments may help decrease adverse effects of naloxone in patients who have chronic narcotic usage for terminal disease or pain relief
- **Naloxone treatment should only be given to patients with respiratory depression (rate less than 8)**
- Patients who are maintaining adequate respirations with decreased level of consciousness do not generally require Naloxone for management
- Naloxone can cause cardiovascular side effects (chest pain, pulmonary edema) or seizures in a small number of patients (1-2%)
- Older patients are at higher risk for cardiovascular complications
- Be prepared for patient agitation or combativeness after naloxone reversal of narcotic overdose

Maintain airway and adequate respirations.
O₂ – titrate to 94-99% SpO₂
Consider IV TKO if indicated

NALOXONE - 1-2 mg IV
If no response consider AEIOU TIPS
If chronic narcotic use suspected Consider for patients with chronic narcotic use for terminal disease or chronic pain:
Dilute 1:10 with normal saline and administer in 0.1 mg (1 ml) increments - titrate to increased respiratory rate

Yes → Signs of shock?
No → Reassess as needed

NALOXONE - 2 mg IN
Adult not in shock but unsuitable for IN (copious secretions)
NALOXONE – 1-2 mg IM
If no response consider AEIOU TIPS

Consider Advanced Airway when indicated - only if naloxone ineffective and BVM ventilation not adequate
**RESPIRATORY DISTRESS**

**Routine Medical Care**
- Asthma
- COPD
- Bronchospasm
- Pulmonary edema (see page 45)

**Limit physical exertion, reduce patient anxiety**

- **O₂ – titrate to 94-99% SpO₂**
- **IV NS**

**Moderate to Severe Distress**
- Mild wheezing/SOB
- Cough
- cyanosis
- Accessory muscle use
- Inability to speak > 2 syllables
- Severe wheezing/SOB

**Assist respirations** and/or
**Consider: CPAP**

**Intubate** as needed for severe distress

**Albuterol**
5 mg in 6 mL NS

**Ipratropium**
500 mcg (2.5 mL)
by nebulizer, BVM, or CPAP*

(*If CPAP equipment is compatible with delivering inline nebulizer treatments)

**Epinephrine 1mg/mL**
0.01 mg/kg IM
max dose 0.5 mg
Pt must have no history of coronary artery disease or hypertension

**NOTE:** For patients with COPD, oxygen supplementation should be given to achieve an oxygen saturation of 88%-92%. Higher oxygen saturations in COPD patients have been shown to be harmful.

**Mild Respiratory Distress**
- Mild wheezing/SOB
- Cough

**Albuterol (only)**
5 mg in 6 mL NS
by nebulizer

If respiratory distress continues, may repeat Albuterol

**If respiratory distress continues**
**Albuterol (only)**
5 mg in 6 mL NS
by nebulizer or via BVM
May repeat x1 if respiratory distress continues

Pt must have no history of coronary artery disease or hypertension.

**RESPIRATORY DISTRESS**

47
**RETURN OF SPONTANEOUS CIRCULATION - ROSC**

- **Routine Medical Care**
- **Remove Impedance Threshold Device (ITD)**
- **Monitor for reoccurrence of arrest rhythm**
- **Transport patients with ROSC at any time to STEMI Center (except critical trauma patients)**
- **If appropriate, transport pediatric patients to Children’s Hospital**

**Note: Transcutaneous Pacing (page 145):** Begin at 80 bpm, 0 mA; increase in increments of 10 mA until capture obtained then increase the output level by 10% if capture maintained but patient remains symptomatic consider increasing the rate by 10 bpm, to a maximum of 100 bpm

- Monitor & support ABCs
- Confirm palpable pulse & auscultated BP
- Monitor EtCO2 (maintain 35-40 mmHg with PPV)
- O2 titrate to 94-99%
- Perform 12-Lead
- Check blood glucose

**Flowchart:***

1. **B/P < 90 systolic**
   - **Pulse < 60 BPM**
     - Give Atropine 0.5 mg IV/IO
       - Repeat q 5 minutes as needed
       - Max. dose 3 mg
     - Transcutaneous Pacing if indicated (see note above)
   - **B/P < 90/syst and Pulse < 60/min**
     - Consider: Fluid Challenge: 500 mL
     - Dopamine: start at 5 mcg/kg/min
   - **B/P < 90 systolic and Pulse > 60 BPM**
     - Consider: Dopamine start at 5 mcg/kg/min
   - **B/P > 90 systolic**
     - Monitor
ROUTINE MEDICAL CARE – ADULT

1. DEFINITIONS:

Baseline vital signs:  
- Pulse rate  
- Blood pressure  
- Respiratory rate  
- Pulse Oximetry  
- Consider temperature

SAMPLE History:  
- S = Signs & symptoms  
- A = Allergies  
- M = Medications  
- P = Pertinent past history  
- L = Last oral intake  
- E = Events leading to the injury/illness

Adapted from Emergency Care and Transportation of the Sick and Injured, 8th Edition

2. SCENE SIZE-UP:

- Substance isolation  
- Scene safety  
- Determine mechanism of injury | nature of illness  
- Determine number of patients  
- Request additional assistance

3. INITIAL ASSESSMENT:

- Form general impression of the patient  
- Assess mental status  
- Assess the airway  
- Assess breathing  
- Assess circulation  
- Identify priority patients

4. TRAUMA PATIENTS: Focused History and Physical Exam - Reconsider mechanism of injury

Significant Mechanism of Injury:  
- Rapid trauma assessment  
- Baseline vital  
- SAMPLE History  
- Transport  
- Detailed physical exam

No Significant Mechanism of Injury:  
- Focused assessment based on chief complaint  
- Baseline vital signs  
- SAMPLE History  
- Transport  
- Detailed physical exam

5. MEDICAL PATIENTS - Focused History and Physical Exam - Evaluate responsiveness

Responsive:  
- History of illness  
- SAMPLE history  
- Focused physical exam based on  
- Chief complaint  
- Baseline vital signs  
- Re-evaluate transport decision  
- Detailed physical exam

Unresponsive:  
- Rapid medical assessment  
- Baseline vital signs  
- SAMPLE history  
- Re-evaluate transport decision  
- Detailed physical exam

6. ONGOING ASSESSMENT

<table>
<thead>
<tr>
<th>Repeat initial vitals signs</th>
<th>Reassess vital signs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat focused assessment</td>
<td>Reassess interventions</td>
</tr>
</tbody>
</table>
ROUTINE MEDICAL CARE – ADULT

7. TREAT AS APPROPRIATE, WITHIN SCOPE OF PRACTICE (See specific treatment protocols)

7.1 Airway:
- Open airway – suction, as needed
- Head tilt / Chin lift or jaw thrust without head extension if C-spine injury suspected
- Oropharyngeal | Nasopharyngeal airway

7.2 Breathing:
7.2.1 Oxygen Administration:
- Administer O₂ – titrate to 94-99% SpO₂ appropriate to patient condition
- If there is a history of COPD, observe for respiratory depression and support respirations as needed. Do not withhold oxygen from a patient in distress because of a history of COPD
- The patient presents with signs and symptoms of pulmonary edema or severe respiratory distress, O₂ should be initiated at 15L/minute by non-rebreather mask

7.2.2 Assist ventilation.
7.2.3 CPAP (see page 126)
7.2.4 Endotracheal intubation, King-LTD (see Advanced Airway Management see page 119)

7.3 Circulation:
- Initiate CPR, as needed.(see page 9)

7.4 Fluid Administration:
- Start an intravenous/intraosseous line as needed
- When IV access is needed, most of the time a saline lock is sufficient. Consider an IV line with Normal Saline when the patient may need to receive volume or when frequent IV meds are being given (e.g. - cardiac arrest)
- When starting an IV/IO/saline lock, use chlorhexidine as a skin prep. Label insertion site with "PREHOSPITAL IV – DATE AND TIME"

8. PATIENT POSITION

8.1 Conscious, no trauma, good gag reflex: Position of comfort

8.2 Depressed Level of Consciousness, no trauma, decreased gag reflex: Left lateral position

8.3 Trauma: Spinal Motion Restriction (SMR), as needed. (see Spinal Motion Restriction (SMR) Procedure page 140). Make sure the patient can be rolled to the side in the event of vomiting

8.4 Pregnancy: Do not lay the patient flat if more than 20 weeks pregnant. Transport either in semi-fowlers position or left lateral decubitus position. If patient requires SMR, secure to a backboard first then tilt the board 20 – 30 degrees to the left

8.5 Respiratory distress: Fowler’s position or position of comfort

9. PATIENT MEDICATIONS

9.1 Field personnel must either bring all medication bottles with the patient to the hospital (preferred), or make a list of the medications, including the drug name, dose and frequency.

9.2 Field personnel may assist patients with the administration of physician prescribed devices, including but not limited to, patient operated medication pumps, sublingual nitroglycerin, and self-administered emergency medications, including epinephrine devices
**SEIZURE**

**Routine Medical Care**
- Midazolam should not be given unless the patient is actively seizing - 3 or more seizures in ≤ 5 minutes or any seizure lasting > 5 minutes.
- Protect the patient from further injury by padding or moving objects as necessary; do not forcibly restrain the patient.

**Maintain airway and adequate respirations**
- Oxygen

**Actively seizing?**
- Yes
  - Check Blood Glucose
  - Result ≤ 60 mg/dL? (Yes/No)
    - Yes: Go to ALOC page 35
    - No: If patient continues to seize consider:
      - Additional Midazolam

**No**
- Reassess as needed

‡ Midazolam IV/IO Route: Administer in 1-2 mg increments. Titrate to seizure control.

Midazolam IM Route: Administer full dose

If ALOC considered, Go to page 35
Sepsis is a potentially deadly medical condition that is characterized by a whole body inflammatory state called Systemic Inflammatory Response Syndrome (SIRS). The body may develop this inflammatory response by the immune system to microbes in the blood, urine, lungs, skin, or other tissues. The syndrome can include fever, tachycardia, tachypnea and hypotension.

1. **Increased risk factors for sepsis include:**

<table>
<thead>
<tr>
<th>MORE COMMON</th>
<th>OTHER RISK FACTORS</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶ Age (Elderly, Newborn)</td>
<td>▶ Cancer</td>
</tr>
<tr>
<td>▶ Diabetes</td>
<td>▶ Renal Disease</td>
</tr>
<tr>
<td>▶ Compromised immune system</td>
<td>▶ Alcoholism / IV Drug Abuse</td>
</tr>
<tr>
<td></td>
<td>▶ Malnutrition</td>
</tr>
<tr>
<td></td>
<td>▶ Hypothermia</td>
</tr>
<tr>
<td></td>
<td>▶ Recent surgery or invasive procedure</td>
</tr>
</tbody>
</table>

2. Although sepsis patients can be any age, the Prehospital Sepsis Screening Tool triages for sepsis patients aged 15 years and older. For these patients, notify the receiving hospital of a SEPSIS ALERT as early as possible via radio or phone.

![Flowchart](https://via.placeholder.com/150)

- **Does patient have suspected or documented infection?**
  - **NO**
  - **YES**
    - **Does patient meet TWO or more of the following criteria?**
      - Temp > 100.4 or < 96
      - HR > 90
      - RR > 20
      - **NO**
      - **YES**
        - Monitor EtCO₂
        - Call a SEPSIS ALERT to the receiving hospital
        - Initiate FLUIDS IV/IO
        - Titrate to patient response
    - **Observe and monitor**
### SEVERE NAUSEA

**Routine Medical Care**
- **Indications:** Intractable vomiting or severe nausea
- **Contraindications:** Hypersensitivity to 5-HT3 receptor antagonists (i.e. – dolasetron (Anzemet), granisetron (Kytril))
- **Relative Contraindications:** Zofran administration during first trimester of pregnancy is not recommended
- **Note #1:** Consider other treatable causes
- **Note #2:** Administering Zofran rapidly can cause syncope
- **Note #3:** If patient has s/s of anaphylaxis/allergic reaction, follow Anaphylaxis/Allergic Reaction policy

### Flowchart

1. **O₂ – titrate to 94-99% SpO₂**
   - Maintain airway
   - IV NS

2. **Is the patient severely nauseated and/or vomiting?**
   - **Yes**
     - **Zofran (ondansetron)**
       - 4 mg IV/ IM/ PO
       - Slowly (over 30 sec.) if given IV

   - **No**
     - Reassess as needed

3. **If no improvement of symptoms**
   - **May** repeat x1 q 15 minutes
**SHOCK: HYPOVOLEMIC/CARDIOGENIC**

- **Routine Medical Care**
  - **Shock** - 2 or more of the following:
    - Pulse > 120/minute
    - BP < 90/systolic
    - Altered Mental Status
    - Pale, cool and/or diaphoretic skin signs
  - Initiate early transport and treat en route, if appropriate.
  - **NOTE**: A fluid bolus of up to 500 ml Normal Saline may be given to an adult patient in cardiogenic shock with clear lung sounds.

- If *anaphylaxis suspected*, see page 36
- If *trauma suspected*, see page 24
- If *sepsis suspected*, see page 52

---

**Cardiogenic Shock**

*Ischemic chest pain with signs and symptoms of shock*

- Consider: 12-Lead EKG
- High Flow O₂ - Assist respirations as needed with Bag-Valve-mask
- Monitor IV/IO NS enroute

**Dysrhythmia Present?**

- Yes
  - Go to appropriate dysrhythmia protocol
- No
  - If lung sounds clear
    - Fluid bolus 250-500 ml IV/IO (see note)
    - Dopamine 2 - 20 mcg/kg/min IV/IO
      - Titrate to patient response
  - Consider: Tourniquet if extremity bleeding is uncontrolled page 130

**Hypovolemic Shock**

- Control Bleeding
  - Second IV NS run IV to maintain B/P > 90/systolic
  - Consider: Fluid Bolus 500 ml IV/IO
Patient Care Policy (Adult)  
Modified On: December 1, 2011

**SUBMERSION**

- **Routine Medical Care**
- Consider spinal precautions prior to extrication if possibility of neck trauma
- Rapid extrication from water
- If *hypothermia* suspected and the patient is in Ventricular Fibrillation, rapid transport to the closest receiving hospital is essential for rewarming. Patients who are hypothermic rarely respond to treatment. (see Hypothermia page 16)
- **Consider CPAP** - see CPAP procedure (page 126) for indications

---

**Flowchart**

- **Pulseless non-breathing?**
  - Yes: Go to appropriate cardiac arrest protocol
  - No:
    - **O₂ – titrate to 94-99% SpO₂**
      - Consider: **Spinal Immobilization**
        - Remove wet clothing
        - Keep warm
    - **Suspect Critical Trauma?**
      - Yes: Go to Trauma Patient Care page 24
      - No: Reassess as needed

---

**Note:** If hypothermia suspected see note above.
**TACHYCARDIA**

**Routine Medical Care**
- Serious Signs and Symptoms:
  - Chest Pain
  - Acute MI
  - Shock
  - CHF
  - BP < 90/systolic
  - Decreased LOC
  - Shortness of Breath
  - Pulmonary Congestion

**Synchronized Cardioversion:**
- Stop if rhythm converts to Sinus Rhythm
- Immediate cardioversion is seldom needed for heart rate < 150 beats/min
- Precadioversion sedation in the awake patient whenever possible, however, use with caution in the hypotensive patient. See Sedation page 138

![Diagram of Tachycardia Management]

- **O₂ – titrate to 94-99% SpO₂**
- **Monitor**
  - **Is patient stable?**
    - **Yes**
      - **IV/ IO NS**
      - **Monitor**
      - **If patient becomes unstable go to appropriate arm of this algorithm**
    - **No**
      - **O₂ – titrate to 94-99% SpO₂**
      - **Monitor**
      - **If no conversion:**
        - **Adenosine**
        - **Monitor**
        - **If patient becomes unstable go to appropriate arm of this algorithm**
        - **Rhythm converts?**
          - **Yes**
            - **Monitor for recurrence. Treat with**
              - **Adenosine**
          - **No**
            - **Look for and treat underlying cause**

**Adenosine dose:**
- 6 mg rapid IV
- If no response in 2 minutes:
  - 12 mg rapid IV

- **Immediate Synchronized Cardioversion**
  - 100 J, 200 J, 300 J, 360 J
  - Monophasic energy dose (or clinically equivalent biphasic energy dose++)
  - If any delay in synchronized cardioversion, and the patient is critical, go to defibrillation.

- **Base Physician consult**
- **12-lead EKG or rhythm strip**
- **Monophasic and biphasic waveforms are acceptable**
- **Vagal maneuver**
- **If no conversion:**
  - **Adenosine**
  - **Monitor**
  - **If patient becomes unstable go to appropriate arm of this algorithm**
- **Rhythm converts??**
  - **Yes**
    - **Monitor for recurrence. Treat with**
      - **Adenosine**
  - **No**
    - **Look for and treat underlying cause**
OVERVIEW:
1. The VAD assists the native ventricle pumping action and provides the cardiac output needed to survive.
2. These devices are either pulsatile or continuous flow (non-pulsatile/pulseless). They are further divided into:
   - Left Ventricular Assist Devices (LVAD), The more common continuous flow pump located in the patient's thorax attached to the patients' left ventricle and aorta
   - Right Ventricular Assist Devices (RVAD),
   - Biventricular Assist Devices (BiVAD).

ASSESSMENT:
3. Assess for presence of a DNR, POLST or Advance Directive.
4. First ASSESS THE PATIENT, not the device.
   - The reason for the call may or may not be a problem with the VAD. VAD patients can and frequently do have other medical conditions.
   - Patients with a continuous flow VAD may have no discernible pulse or blood pressure.
     ▶ Because there may be no palpable pulse, utilize other parameters for patient assessment (level of consciousness, skin signs, capillary refill, etc.)
     ▶ Pulse oximetry may be unreliable.
   - Utilize the American Heart Association’s C-A-B recommendations, with one addition:
     ▶ C = Circulation / Connections and Function (device)
     ▶ A = Airway
     ▶ B = Breathing
   - ETCO2 will read accurately and be useful in assessment.
5. Assess the device to see if it is working.
   - Information regarding the type of device, the implantation hospital, and/or the VAD Coordinator contact telephone number may be available by a tag on the device, on the refrigerator, or on a medical alert bracelet.
   - If a caregiver is present, utilize his/her knowledge. The patient and their caregiver are the experts on scene for all issues related to the VAD. Listen to their directions regarding VAD device management until you are able to contact the VAD Coordinator.
   - The VAD Coordinator can help you decide the best course of action regarding assessment of the equipment. NOTE: Only the base hospital is legally allowed to give orders regarding patient care.
   - If the patient has a continuous flow VAD (non-pulsatile / pulseless), auscultate the left upper quadrant of the patient's abdomen for the “hum” of the VAD, which can help direct the appropriate actions.
     ▶ A pulsatile VAD will make an audible sound without auscultation.
     ▶ Pulsatile VADs are usually older devices which pump blood via pulsatile mechanism, generating a peripheral pulse.
   - Determine if the device has power.
     ▶ If the device has power it does not necessarily mean that it is working, so the previous step is very important.
     ▶ If the device has power, you will see a green light on the HeartMate II, the most commonly implanted device
     ▶ On the HeartWare device, the display will clearly tell you the Liters per Minute (LPM) of blood flow.
   - Check the VAD for secure connections and that the batteries are charged and functional.
6. Remain patient-centric. Check the VAD device as directed, but remain aware of how your patient is doing clinically. Deliver routine medical care as required.
   - If the pump is pumping then the problem is usually with the patient, not the device.
   - Do ABCs in conjunction with your VAD assessment.
TREATMENT/TRANSPORT:

7. If the patient's condition is related to their VAD, and it is safe and reasonable, it is preferred to transport the patient to their Bay Area VAD centers (Kaiser Santa Clara, Stanford, UCSF, and CPMC) unless the patient has any of the following conditions:

7.1 MINOR medical or trauma patients with adequate perfusion: Follow appropriate protocol and transport to ANY basic ED or hospital of record.

7.2 Suspected STROKE (STROKE ALERT) patient: Follow Acute Stroke policy and transport to closest Stroke Center.

7.3 Suspected STEMI (STEMI ALERT) patient: Follow CP Suspect Cardiac/STEMI policy and transport to closest STEMI Center.

7.4 Trauma patient (activation): Follow Trauma Care Policy and transport to closest Adult Trauma Center.

7.5 Cardiac Arrest or critical / unstable patients (poor perfusion): Follow Shock or appropriate resuscitation policy and transport to closest STEMI / Cardiac Arrest Center.

7.6 "Ring down" the receiving hospital early to help the facility prepare for this highly specialized patient.

*Stanford Hospital and Clinics & Lucille Packard Children's Hospital at Stanford share the same VAD Coordinators
**Ventricular Fibrillation** | **Ventricular Tachycardia: Pulseless**

- Routine Medical Care
- Note: Use of a mechanical CPR device is required whenever available and appropriate

**NOTE:** If after 2 minutes of continuous chest compressions and BVM support an immediate endotracheal airway cannot be obtained, consider use of supraglottic airway.

**Note - Defibrillation:** Refer to manufacturer’s documentation for energy dose recommendations.

- Witnessed/Unwitnessed Arrest
  - CPR until defibrillator available/charged

- **O₂ - High Flow ITD Monitor**

- **Shockable Rhythm?**
  - Yes
    - **Defibrillate (see note)**
    - Resume CPR
    - Place advanced airway
    - IV/IO NS
  - No
    - CPR while defibrillator charging
    - **Defibrillate (see note)**
    - Resume CPR
    - Epinephrine 0.1mg/mL 1 mg IV/IO
      - Repeat q 3-5 minutes
    - Go to Policy:
      - Asystole/PEA page 37
      - Return of Spontaneous Circulation page 48

- 2 minutes or 5 cycles of CPR
  - Check Rhythm
  - Yes
    - Shockable Rhythm?
      - Yes
        - CPR while defibrillator charging
        - **Defibrillate (see note)**
        - Resume CPR
        - Epinephrine
        - 300 mg IV/IO
        - Repeat Epinephrine
        - +Amiodarone 150 mg IV/IO
        - 3-5 minutes after 1st dose
        - Refractory VF/VT patients should be transported to the closest, most appropriate STEMI Center
      - No
        - CPR while defibrillator charging
        - **Defibrillate (see note)**
        - Resume CPR
        - Epinephrine
        - +Amiodarone 300 mg IV/IO
        - Repeat Epinephrine
    - No
      - CPR while defibrillator charging
      - **Defibrillate (see note)**
      - Resume CPR
      - Epinephrine
      - +Amiodarone 300 mg IV/IO
      - Do not interrupt CPR to administer medications
      - 2 minutes or 5 cycles of CPR
      - Check Rhythm
      - Yes
      - Shockable Rhythm?
        - Yes
      - No
      - Refractory VF/VT patients should be transported to the closest, most appropriate STEMI Center

**Note - Defibrillation:** Refer to manufacturer’s documentation for energy dose recommendations.

**+Amiodarone:** may only be given twice. Flush tubing with 20 ml NS.

**AIRWAY OBSTRUCTION**

**• Pediatric Routine Medical Care**
- If airway obstruction is caused by laryngeal trauma, see page 24 "Trauma Patient Care"
- Do not use a tongue/jaw lift or perform blind finger sweeps
- Obstruction due to suspected epiglottitis:
  - Do not attempt to visualize the throat or insert anything into the mouth

**• Note:** Perform endotracheal intubation only if BVM ventilation is unsuccessful or impossible.

**• Rapid Transport**

*Severe signs of obstruction?*

Yes

- If the patient is < 1 year old:
  - Deliver 5 back blows followed by 5 chest thrusts.
- If the patient is ≥ 1 year old:
  - Apply abdominal thrusts in rapid sequence.
  - If ineffective, consider chest thrusts.

No

Observe

*Signs of severe obstruction*

- Poor air exchange
- Increased breathing difficulty
- Silent cough
- Cyanosis
- Inability to speak or breathe
- Ask the patient “Are you choking”? If patient nods yes, act

If the patient becomes unresponsive:

- Begin CPR
- Check for F.B.
  - Only remove if seen in the pharynx

Assist Ventilation with Bag-Valve-Mask or Attempt Intubation (see note)

Able to ventilate adequately?

Yes

- Maintain airway and Oxygen

No

Transport to the closest ED
ANAPHYLAXIS / ALLERGIC REACTION

• **Epinephrine IM** is the cornerstone of treatment of anaphylaxis and should be given as early as possible. It is best absorbed from an injection in the lateral thigh.
• If the patient is in severe distress, **administer Epinephrine IM** and consider immediate transport.
• **SIGNS OF ANAPHYLAXIS (Systemic Reaction)** – wheezing, repetitive cough, tightness in chest, stridor, difficulty swallowing or tightness in throat, change in voice, dizziness or feeling faint, abdominal complaints (pain, repeated vomiting, diarrhea or incontinence), anxiety, lethargy.
• **SIGNS OF ANAPHYLACTIC SHOCK** – pallor, hypotension, cool, clammy mottled skin, altered sensorium.
• **HIVES/ITCHING or FLUSHED SKIN** often accompanies anaphylaxis, but is not always present.
• Use a length-based resuscitation tape (LBRT) to determine pediatric drug doses and fluid bolus.

---

**ANAPHYLAXIS (Systemic Reaction)**

**OXYGEN**
If Any Distress

**EPINEPHRINE 1mg/mL**
0.01 mg/kg IM

- Minimum single dose 0.1 mg
- Maximum single dose 0.5 mg
- May Repeat x 1 in 15 min.

**YES**

**SIGNS OF SHOCK?**

**OXYGEN**
If Any Distress

**IV/IO NS**
FLUID BOLUS NS
20 ml/kg
Assist ventilations with BVM as required

Reassess 5-10 mins. after IM epi. If VS not improved with fluid bolus:
**EPINEPHRINE 0.1mg/mL**
0.01 mg/kg IV/IO slowly***
- Max single dose 0.1 mg
- May repeat q 10 minutes

If no response
Base Physician consult

**NO**

For persistent wheezing or respiratory distress

**ALBUTEROL**
5 mg in 6 ml NS via hand-held nebulizer, mask, or BVM
Consider for Urticaria (Hives/Itching)

**DIPHENHYDRAMINE**
1 mg/kg IV/IO/IM
up to 50mg

**AlE*LLERGIC REACTION**
(Skin or mucous membrane symptoms only without signs of anaphylaxis or airway obstruction)

Consider for Urticaria (Hives/Itching)

**DIPHENHYDRAMINE**
1 mg/kg IV/IM up to 50mg

---

**NOTES**

* If patient develops signs of anaphylaxis, go to other arm of this algorithm.

**Shock in children may be subtle and hard to recognize. BP readings may be difficult to determine or inaccurate and may be a late sign of shock.

*** IV/IO epinephrine should only be used if symptoms are unresponsive to IM epinephrine and patient has signs of profound shock.

§ Diphenhydramine may lessen discomfort from rash/itching but is not an essential treatment of anaphylaxis. Consider reduced dosage if patient has taken diphenhydramine in the past 1-2 hrs.
ALTERED LEVEL OF CONSCIOUSNESS

- **Pediatric Routine Medical Care**
  - Naloxone **should not** be given as treatment for altered level of consciousness in the absence of respiratory depression (respiratory depression = rate of less than 12 breaths per minute) (see page 74)
- **Note: Oral Glucose** may be administered if the patient: 1) is able to hold head upright; 2) has a gag reflex; and, 3) can self-administer the medication
- **Consult with the Base Physician** if the Blood Glucose reading is ≥ 60 mg% but hypoglycemia is suspected
- **Use an LBRT to determine pediatric drug doses** (Shown underlined on the algorithm)

```
ALTERED LEVEL OF CONSCIOUSNESS

Maintain airway and adequate respirations.
O₂ – titrate to 94-99% SpO₂
IV/IO NS

Check Blood Glucose

Results
< 60 mg/dL?
(<40 mg/dL for newly born)

Yes

Newly Born (< 30 mins. of life)
**Dextrose 10%** 0.2 g/kg = 2 ml/kg IV/IO

> 30 minutes and ≤ 14 y.o.
**Dextrose 10%** 0.5 g/kg = 5 ml/kg IV/IO
maximum initial dose 10g (100 ml)

Give additional
**DEXTROSE 10%**
5g (50 ml) increments to total 15g (150 ml)
if Glucose remains 60 or less

No

IV/IO Access?

Yes

Oral Glucose
15 - 30 gms po
(see note above)
Or
Glucagon
0.1 mg/kg IM
maximum dose 1 mg

No

Adequate response?

Yes

Reassess
As needed

No

Consider AEIOU – TIPS
```

**ALOC**
- blood glucose
- hypoglycemia
dextrose
- glucagon
- glucose paste
- naloxone
dextrose 25% (D25)
dextrose 10% (D10)
1. **DEFINITION:**
   1.1 An Apparent Life-Threatening Event (ALTE) was formally known as a “near-miss SIDS” episode.
   1.2 An ALTE is an episode that is frightening to the observer (may think the infant has died) and involves some combination of:
      - **Apnea** (central or obstructive)
      - **Color change** (cyanosis, pallor, erythema, plethora)
      - **Marked change in muscle tone** (limpness)
      - **Choking** or **gagging**
   1.3 Usually occurs in infants < 12 months old, however, any child less than 2 years old who exhibits the symptoms in 1.2 may be considered an ALTE.
   1.4 Most have a normal physical exam when assessed by responding field personnel.
   1.5 50–60% have no known etiology.
   1.6 40–50% have an identifiable etiology (e.g. Child abuse, SIDS, swallowing dysfunction, infection, bronchiolitis, seizures, CNS anomalies, tumors, cardiac disease, chronic respiratory disease, upper airway obstruction, metabolic disorders, or anemia).

2. **MANAGEMENT**
   2.1 Assume the history given is accurate.
   2.2 Determine the **severity**, **nature** and **duration** of the episode:
      - was the patient awake or asleep at the time of the episode.
      - details of the resuscitation required.
   2.3 Obtain a **medical history**:
      - known chronic diseases
      - evidence of seizure activity
      - current or recent infections
      - gastroesophageal reflux
      - inappropriate mixture of formula
      - recent trauma
      - medication history (current and recent).
   2.4 Do a **comprehensive physical exam** that includes the general appearance of the child, skin color, extent of interaction with environment, and evidence of trauma.
   2.5 Perform **glucose analysis** if hypoglycemia suspected.
      (see ALOC page 64 if B.S. < 60mg/ dL).
   2.6 Treat any identifiable causes.
   2.7 Transport.
   2.8 **Note:** **Contact the Base Physician** for consultation if the parent/guardian is refusing medical care and/or transport, **prior to** completing a Refusal of Care form.
BRADYCARDIA

• Pediatric Routine Medical Care
• Consider and treat other possible causes:
  ➔ Hypoxemia ➔ Hypothermia ➔ Head Injury
  ➔ Heart Block ➔ Toxins/drugs ➔ Beta Blockers or calcium channel blockers

• Note: TCP reserved for children with profound symptomatic bradycardia refractory to BLS and ALS. Use pediatric electrodes if child weighs < 15 kg

• Use an LBRT to determine pediatric drug doses
(Shown underlined on the algorithm)

✓ Support ABCs - if needed
✓ O₂ – titrate to 94-99% SpO₂
✓ Attach monitor

✓ Begin CPR
✓ NS IV/IO

 Persistent symptomatic bradycardia?

✓ Epinephrine 0.1mg/mL
  IV/IO: 0.01 mg/kg (0.1 ml/kg)
  Repeat q 3-5 min

If increased vagal tone or primary AV block:
  Atropine
  ✓ First dose: 0.02 mg/kg
  ✓ May repeat q 3-5 minutes:
    § minimum dose 0.1 mg.
    § maximum total dose 1 mg.

✓ Consider TCP – see page 145
  (see note above)
✓ Consider sedation with:
  Midazolam - see page 138

If asystole develops, go to:
  Pulseless Arrest - Asystole page 72

No
**NEONATAL RESUSCITATION**

- **Pediatric Routine Medical Care**
- Resuscitation should be initiated on all premature infants who meet the following criteria:
  - **Weight:** > 500 gms or 1 pound and **Gestational Age:** ≥ 20-24 weeks
- If naloxone considered for persistent respiratory depression, HR and color must first be restored
- Avoid naloxone for neonates whose mothers are suspected of long-term exposure to opioids
- **Note:** Perform endotracheal intubation only if BVM ventilation is unsuccessful or impossible
- **Use an LBRT to determine pediatric drug doses**
  (Shown underlined on the algorithm)

```
Term Gestation? Amniotic fluid clear? Breathing or crying? Good muscle tone?

Yes

✓ Provide warmth
✓ Position - Clear airway if needed
✓ Dry, stimulate, reposition

No

Breathing & HR > 100?

Yes

✓ Provide warmth
✓ Clear airway if needed
✓ Dry off
✓ Assess color

No

Apneic or HR < 100

Positive pressure ventilation 40-60 breaths/minute

Yes

HR < 60?

✓ Continue ventilation
✓ Administer chest compressions
  compression:ventilation ratio 3:1 (90:30 for a total of 120 combined events/minute)

No

Epinephrine 0.1mg/mL
0.01 mg/kg IV/ IO (0.1ml/kg)
Fluid bolus 10 ml/kg – may need to repeat

```
INTRODUCTION: The goal of this policy is to provide pain management to pediatric patients prior to and during transport as part of their treatment. Fentanyl is a powerful synthetic opiate that is 100 times stronger than morphine and should be used cautiously. Fentanyl should be administered in an amount sufficient to reduce their pain. Virtually all patients complaining of moderate to severe pain, regardless of etiology, may be candidates for pain management.

### Pain Management Criteria

<table>
<thead>
<tr>
<th>Pain Management Criteria</th>
<th>Base Contact Required</th>
<th>Treatment</th>
</tr>
</thead>
</table>
| Any patient with a complaint of significant pain, including: | No unless > maximum dose of fentanyl is needed | **O₂ – titrate to 94-99% SpO₂**  
**Monitor EtCO₂**  
**IN:** Fentanyl 2 mcg/kg. Max single dose 100 mcg.  
May repeat q 10 minutes to max total dose of 200 mcg  
**IV NS or saline lock (if necessary)**  
**IV/IM/IO:** Fentanyl 2 mcg/kg slow IV (over 1 minute). Max single dose 100 mcg.  
May repeat q 5 minutes to max total dose of 200 mcg (q 10 minutes IM)  
**SEE DOSE CHART BELOW** |
| Critical Trauma patients, including: | Yes | **Contact the Base Physician**  
prior to administering any pain medication |
| ➔ Abdominal trauma  
➢ Thoracic trauma  
➢ Decreased respirations  
➢ Altered mental status  
➢ Patients with pain not covered above  
➢ BP outside normal limits | |

![FACES Scale](image)

**Brief initial instructions:**

Point to each face using the words to describe the pain intensity. Ask the child to choose face that best describes their own pain and record the appropriate number.

**Original instructions:**

Explain to the person that each face is for a person who feels happy because he has no pain (hurt) or sad because he has some or a lot of pain. Ask the person to choose the face that best describes how he/she is feeling.

- **Face 0** is very happy because he doesn't hurt at all
- **Face 2** hurts just a little bit
- **Face 4** hurts a little more
- **Face 6** hurts even more
- **Face 8** hurts a whole lot
- **Face 10** hurts as much as you can imagine, although you don't have to be crying to feel this bad

PULSELESS ARREST: ASYSTOLE, PEA

- **Pediatric Routine Medical Care**
- In PEA, identify other causes and treat (See CPR page 10)
- **Note:** Perform endotracheal intubation only if BVM ventilation is unsuccessful or impossible
- **Use an LBRT to determine pediatric drug doses**

(Shown underlined on the algorithm)

---

**CPR**
- O₂ – High Flow
- Monitor

**Shockable rhythm?**
- Yes
  - Resume CPR
  - IV/IO NS
  - Intubate as needed
  - **Epinephrine 0.1mg/mL**
  - 0.01 mg/kg IV/IO (0.1 ml/kg)
  - Repeat q 3-5 minutes

- No
  - 2 minutes CPR
  - 30:2 5 cycles 1 rescuer
  - 15:2 10 cycles 2 rescuers
  - Check rhythm

**Shockable rhythm?**
- Yes
  - Go to: Pulseless Arrest – V-fib/V-tach
- No
  - Base
  - Physician
  - Consult

- **Non-shockable rhythm continues?**
  - Yes
    - Go to appropriate dysrhythmia protocol
  - No
    - **Discontinuation of CPR:**
      - If pulse present - post resuscitation care
      - **Discontinuation of CPR**
      - ✓ Continue CPR and drug administration
      - ✓ Transport

- **Discontinuation of CPR:**
  - if non-shockable rhythm persists, despite appropriate ALS interventions and up to three rounds of drugs, consider discontinuation of CPR

---

^Discontinuation of CPR:
- if non-shockable rhythm persists, despite appropriate ALS interventions and up to three rounds of drugs, consider discontinuation of CPR
**PULSELESS ARREST: VF/ VT**

- **Pediatric Routine Medical Care**
- **Note:** Perform endotracheal intubation only if BVM ventilation is unsuccessful or impossible
- **Use an LBRT to determine pediatric drug doses**
  (Shown underlined on the algorithm)

**Witnessed/Unwitnessed Arrest**
- CPR until defibrillator available/charged

**O₂ – High Flow Monitor**

**Shockable rhythm?**
- Yes: Defibrillate 2 J/kg
- Yes: Resume CPR
- Yes: Intubate as needed
- Yes: IV/IO NS

**2 minutes CPR**
- 30:2: 5 cycles 1 rescuer
- 15:2: 10 cycles 2 rescuers
- Check rhythm

**Shockable rhythm?**
- Yes: CPR while defibrillator charging
- Yes: Defibrillate 4 J/kg
- Yes: Resume CPR
- Yes: Epinephrine 0.1mg/mL IO/IV: 0.01 mg/kg (0.1 ml/kg)
  Repeat q 3-5 minutes

**Go to:**
- Pulseless Arrest – Asystole/PEA
- If pulse present - post resuscitation care

**Do not interrupt CPR to administer medications**

**Flush tubing with 20ml NS**
**RESPIRATORY DEPRESSION OR APNEA (SUSPECTED NARCOTIC OD)**

- **Routine Medical Care**
- **SAFETY WARNING!** Naloxone will cause acute withdrawal symptoms in patients who are habituated users of narcotics (whether prescribed or from abuse)
- Use of diluted Naloxone IV and titration with small increments may help decrease adverse effects of naloxone
- Naloxone treatment should only be given to patients with respiratory depression (rate less than 12)
- Patients who are maintaining adequate respirations with decreased level of consciousness do not generally require Naloxone for management
- Naloxone can cause cardiovascular side effects (chest pain, pulmonary edema) or seizures in a small number of patients (1-2%)
- Be prepared for patient agitation or combativeness after naloxone reversal of narcotic overdose

---

**Maintain airway and adequate respirations.**

- $O_2$ – titrate to 94-99% $SpO_2$
- Consider IV TKO if indicated

**NALOXONE -0.1 mg/kg IV**

- Maximum dose 2 mg
- If no response consider AEIOU TIPS

**NALOXONE -0.1 mg/kg IM**

- Maximum dose 2 mg
- If no response consider AEIOU TIPS

- Yes
  - Signs of shock?
- No

**Reassess as needed**

**Consider Advanced Airway when indicated - only if naloxone ineffective and BVM ventilation not adequate**
**RESPIRATORY DISTRESS (STRIDOR) – UPPER AIRWAY**

- **Pediatric Routine Medical Care**
- **CROUP/EPIGLOTTITIS:**
  - If the patient deteriorates, or becomes completely obstructed, positive pressure ventilation via bag-valve-mask should be attempted.
  - **Do not** attempt to visualize the throat or insert anything into the mouth if epiglottitis suspected.
  - Allow a parent to hold the child or the O₂ mask if the presence of the parent calms the child.
  - Minimize outside stimulation. Keep the patient calm.
  - Position of comfort.
- **Note:** Perform endotracheal intubation only if BVM ventilation is unsuccessful or impossible.
- **Use an LBRT to determine pediatric drug doses**
  (Shown underlined on the algorithm)

---

**Flowchart:**

- **Suspect foreign body?**
  - Yes: Go to **Airway Obstruction page 62**
  - No: Continue

- **Suspect allergic reaction?**
  - Yes: Go to **Allergic Reaction page 63**
  - No: Continue

- **Suspect epiglottitis?**
  - Yes: Maintain airway and Oxygen
    - If apneic or near-apneic Consider: B-V-M or Intubation
  - No: O₂ – titrate to 94-99% SpO₂ via blowby or Non-rebreather Mask

- **Maintain airway and oxygen**
  - If decreased LOC or apnea, assist ventilation
  - Consider: B-V-M or Intubation
    (see note)
**Moderate to Severe Distress**

Any of the following:
- Cyanosis
- Accessory muscle use
- Inability to speak > 2 syllables
- Severe wheezing/SOB

Assist respirations and/or Intubate as needed for severe distress (see note)

**Albuterol**

5 mg in 6 ml NS and

**Ipratropium**

500 mcg (2.5 ml) by nebulizer or via BVM

If response inadequate:

**Epinephrine 1mg/mL**

0.01 mg/kg IM

Maximum single dose: 0.3 mg

May repeat x1 in 20 mins.

If respiratory distress continues

**Albuterol (only)**

5 mg in 6 ml NS by nebulizer or via BVM

May repeat x1 if respiratory distress continues

**Maintain airway and oxygen**

If decreased LOC or apnea, assist ventilation

Consider: B-V-M or Intubation (see note)

**O₂ – titrate to 94-99% SpO₂**

via blowby or non-rebreather mask

**Mild Respiratory Distress**

- Mild wheezing/SOB
- Cough

**Albuterol**

5 mg in 6 ml NS via hand-held nebulizer, mask or BVM

May repeat x1
The defined age of a pediatric patient is 14 years old or less, and unless specified otherwise, pediatric protocols should be used to treat these patients. Note: An infant is considered to be < 1 year old. A child is considered to be ≥ 1 year old. Specified ages for transport or treatment other than 14 years old include:

**TRANSPORT**

5150 Psych Evaluation (page 113):
- Children (≤ 11 y.o.) – Children’s Hospital
- Adolescents (≥ 12 y.o. & ≤ 17 y.o.) – Willow Rock

Trauma Destination (page 26):
- ≤ 14 y.o. – Children’s Hospital
- ≥ 15 y.o. – Closest Adult Trauma Center

USE A 1 ML SYRINGE FOR MIDAZOLAM ADMINISTRATION TO PEDIATRIC PATIENTS
SEVERE NAUSEA

**Routine Medical Care**

**Indications:** Intractable vomiting or severe nausea in patients aged 4 years and older

**Contraindications:** Hypersensitivity to 5-HT3 receptor antagonists (i.e. – dolasetron (Anzemet), granisetron (Kytril))

**Note #1:** Consider other treatable causes

**Note #2:** Administering Zofran rapidly can cause syncope

**Note #3:** If patient has s/s of anaphylaxis/allergic reaction, follow Anaphylaxis/Allergic Reaction policy

---

O₂ – titrate to 94-99% SpO₂

Maintain airway

IV NS

**Is the patient severely nauseous and/or vomiting?**

Yes

*Zofran (ondansetron)*

0.1 mg/kg IV/IM

Slowly (over 30 sec.) if given IV

Max single dose 4 mg IV/IM

4 mg PO

If symptoms do not improve

Yes

Is the patient > 40kg?

No

**Repeat x1 q 15 minutes**

**Contact Base Hospital**

No

Reassess as needed

---

*PO is the preferred route of administration for pediatric patients*
• Pediatric Routine Medical Care

• NOTE: Shock in children may be subtle and hard to recognize. Determining BP may be difficult and readings may be inaccurate

• IMPORTANT SIGNS OF SHOCK:
  ➔ Cool, clammy, mottled skin
  ➔ Pallor - due to decreased skin perfusion
  ➔ Altered level of consciousness - due to decreased perfusion to the brain
  ➔ BP < 70 systolic

• Initiate early transport and treat en route, if appropriate
  ➔ Go to Trauma Patient Care (page 24) if trauma suspected
  ➔ Go to Allergic Reaction (page 63) if anaphylaxis suspected

• Use an LBRT to determine pediatric drug doses
  (Shown underlined on the algorithm)

Cardiogenic Shock

Hypovolemic Shock

Septic Shock

Spinal Shock

Contact base physician

Base physician consult

Hypovolemic Shock

Septic Shock

Spinal Shock

✓ Control Hemorrhage, if appropriate
✓ NS IV/ IO - 20 ml/kg
✓ Fluid Bolus

Continuing signs of shock?

Yes

No

Repeat Fluid Bolus

Reassess as needed
**Pediatric Routine Medical Care**
- Contact the Base Physician if patient is also showing signs of pulmonary edema before moving to the appropriate policy
- Consider CPAP (see CPAP page 126 for indications)
- Consider spinal precautions prior to extrication if possibility of neck trauma. Otherwise place the patient on his/her side to protect the airway and prevent aspiration; be prepared to suction
- Rapid extrication from water

**Note:** If hypothermia is suspected and the patient is in ventricular fibrillation, rewarming is essential. Remove wet clothing, wrap in warm blankets and place in warm ambulance
- Initiate rapid transport to the closest most appropriate receiving hospital

---

**Flowchart:**

- **Pulseless non-breathing?**
  - Yes: If hypothermia suspected, see note above
  - No: **O₂ – titrate to 94-99% SpO₂**
    - ✓ Consider: Spinal Immobilization
    - ✓ Remove wet clothing
    - ✓ Keep warm

- **Suspect Critical Trauma?**
  - Yes: Go to Trauma Patient Care page 24
  - No: Reassess as needed
**TACHYCARDIA**

- Pediatric Routine Medical Care
- Use an LBRT to determine pediatric drug doses

(Shown underlined on the algorithm)

- Support ABCs if needed
- O₂ – titrate to 94-99% SpO₂
- Attach monitor

**Narrow QRS**

- ≤ 0.08 sec

Evaluate rhythm
Consider causes: compensatory vs. non-compensatory

- Sinus Tachycardia
  - < 220/min - infant
  - < 180/min - child
  - P waves - present/normal
  - R to R - variable
  - PR - constant

  Treat underlying cause, consider: **Fluid bolus**

- **Supraventricular Tachycardia (SVT)**
  - > 220/min - infant
  - > 180/min - child
  - P waves - absent/abnormal
  - Heart rate - constant

If stable (with pulses and good perfusion)

- If stable (with pulse but poor perfusion)

Consider: **Vagal Maneuver**

**Adenosine**

- 0.1 mg/kg - rapid IV push (max 1st dose 6 mg)
- May repeat 0.2 mg/kg - rapid IV push (max 2nd dose 12 mg)

If unstable (with pulses but poor perfusion)

- Synchronized Cardioversion
  - 0.5 - 1 J/kg
  - If not effective, increase to 2 J/kg
  - Consider **Sedation**
  - but do not delay cardioversion
  - See **Sedation page 138**

Possible/probable V-tach

- If stable (with pulses and good perfusion)

Consult with Base Physician for **Amiodarone**

- 5 mg/kg IV/IO
- Over 20-60 minutes

- If unstable (with pulses but poor perfusion)

Evaluate QRS duration

**Wide QRS**

- > 0.08 sec
1. **ALS PERSONNEL** - In Alameda County, an "ALS responder" is defined as: An individual who is licensed as a paramedic in the state of California and accredited to practice in Alameda County.

2. **MEDICAL MANAGEMENT**

2.1 An ALS responder is responsible for the care of the patient after accepting responsibility from the first responder personnel until the care of the patient is turned over to the staff at the receiving hospital (if transported), or until the patient leaves the scene.

2.2 Consider a second *accredited* paramedic to accompany the transporting paramedic for critical patients (e.g. - arrest, complicated airway, ROSC, severe trauma, STEMI, etc.)

2.3 Initiate "START" triage if appropriate. (See page 159 "Multi-Casualty Incident - EMS Response (MCI)"

2.4 If it is determined that helicopter transport of the patient might be necessary, activate the air ambulance and secure an appropriate landing zone. (see page 93 "EMS Aircraft"

2.5 A verbal and written Patient Care Report (PCR) must be completed for every patient, describing the care rendered and given to the staff at the receiving hospital. (exception: see page 159 "Multi-Casualty Incident – EMS Response (MCI)" and page 121 “Refusal of Service"

2.6 The PCR should include a chief complaint, a general assessment, a physical assessment and emergency care rendered by the ALS responder.

3. **PATIENT CARE**

3.1 The following should be performed for each patient during an emergency response:

3.1.1 A physical assessment and initiation of emergency first aid, basic life support, and/or advanced life support, as necessary

3.1.2 A PCR must be completed for every patient (exception: Multi-Casualty Incident and Refusal of Service)

3.2 ALS responders are held to the following standards during patient care:

3.2.1 American Heart Association, or an approved equivalent, for:

   ▶ CPR
   ▶ Basic Life Support (healthcare provider)
   ▶ Advanced Cardiac Life Support
   ▶ Emergency Cardiac Care

3.2.2 PEPP (Pediatric Education for Prehospital Personnel), or Pediatric Advanced Life Support (PALS), or Emergency Pediatric Care (EPC), or an approved equivalent

3.2.3 "S.T.A.R.T. Triage"

3.2.4 OSHA and CAL-OSHA for infection control

3.2.5 International Trauma Life Support (ITLS), PreHospital Trauma Life Support (PHTLS), Assessment and Treatment of Trauma (ATT) or an approved equivalent

3.2.6 Approved training program curriculum for emergency first aid and patient assessment

3.2.7 Alameda County EMS policies for patient care not covered by, or in addition to the above
1. **BLS PERSONNEL** - In Alameda County, BLS personnel are:
   
   1.1 Public Safety personnel (life guard, firefighter or peace officer) trained in "First Aid for Public Safety Personnel", according to the standards defined in Title 22, Chapter 1.5
   
   1.2 Individuals who are **certified as an EMT-1** by a California local EMS agency, the California State Fire Marshall's Office, or another certifying authority

2. **MEDICAL MANAGEMENT**

   2.1 The first responder is responsible for the care of the patient, once contact with the patient has occurred and continues that responsibility until care of the patient is turned over to the arriving ambulance personnel

   2.2 If it is determined that the incident does not involve illness or injury, the first responder should cancel the ambulance response (see page 114 "Responding Units - Canceling/Reducing Code")

   2.3 If it is determined that helicopter transport of the patient might be necessary, activate the air ambulance and secure an appropriate landing zone (see page 93 "EMS Aircraft")

   2.4 A verbal report **must** be given to the arriving ambulance personnel before the care of the patient may be turned over. The first responder form should include a chief complaint, physical assessment and emergency care rendered by the first responder

   2.5 The first responder must remain on scene until an approved ambulance provider arrives and patient care is transferred. The first responder may return to service once patient care is transferred, or remain on scene and assist as necessary

   2.6 Initiate "START" triage as necessary (see page 159 "Multi-Casualty Incident - EMS Response")

3. **PATIENT CARE**

   3.1 The following should be performed for each patient during an emergency response:

   3.1.1 A physical assessment and initiation of emergency first aid or basic life support as necessary (see page 49 "Routine Medical Care").

   3.1.2 A first responder form must be completed for **every** patient (exception: see page 159 “Multi-Casualty Incident - EMS Response” and page 121 “Refusal of Service”).

   3.2 First responders are held to the following standards during patient care:

   3.2.1 American Heart Association for CPR and Basic Life Support (including airway obstruction and ventilation techniques).

   3.2.2 Approved training program curriculum for emergency first aid.

   3.2.3 "S.T.A.R.T. Triage" for MCI.

   3.2.4 Alameda County Policy “Multi-Casualty Incident - EMS Response” page 159 for medical management at a MCI.

   3.2.5 OSHA and CAL-OSHA for infection control.

   3.2.6 Alameda County EMS policies for protocols not covered by, or in addition to the above
1. INTRODUCTION

1.1 EMTs and paramedics do not pronounce death but rather determine death based on predetermined criteria. An assessment by paramedics and consultation with the base hospital physician is required for determination of field death not covered by this policy.

1.2 Prehospital personnel are not required to initiate resuscitative measures when death has been determined or the patient has a valid "Prehospital Do Not Resuscitate" directive. Paramedics should contact the Base Physician anytime support in the field is needed.

1.3 If a DNR directive is not present at the scene, but a person who is present and who can be identified as an immediate family member or spouse requests no resuscitation and has the full agreement of any others who are present on scene, resuscitation may be withheld or stopped if it has already been initiated.

1.4 If any doubt exists, begin CPR immediately. Once initiated, CPR should be continued unless it is determined the patient meets determination of death criteria (section 2), a valid DNR form is presented (section 3) or the patient meets criteria to discontinue CPR (section 4).

1.5 Multi-casualty incidents are an exception to this policy.

1.6 The local public safety agency having jurisdiction will be responsible for the body once death has been determined. A dead body may not be moved or disturbed until a disposition has been made by the coroner’s bureau.

2. DETERMINATION OF DEATH

2.1 CRITERIA FOR DETERMINATION OF DEATH IN THE FIELD:

2.1.1 Apnea

2.1.2 Pulselessness - No heart tones and no carotid or femoral pulses.

2.1.3 Documented non-shockable rhythm:
   ► EMT-1s: A non-shockable rhythm on the monitor for one minute
   ► Paramedics: non-shockable rhythm on the monitor screen for one minute documented in 2 leads

2.2 Only the following patients who exhibit all of the above criteria for determination of death and one or more of the following conditions may be determined dead:

2.2.1 PATIENTS WHO ARE OBVIOUSLY DEAD **Documentation of all Determination of Death criteria may not be necessary or possible in these patients
   ► Decomposition of body tissues**
   ► Total decapitation**
   ► Total incineration**
   ► Total separation or destruction of the heart or brain**
   ► Any degree of rigor
   ► Lividity (dependant pooling of blood resulting in skin discoloration)

2.2.2 PATIENTS WHO ARE IN ARREST
   ► Medical (Cardiac) Arrest - Discontinuation of CPR: if non-shockable rhythm persists, despite appropriate, aggressive ALS interventions for 30 minutes, consider discontinuation of CPR
   ► Trauma Arrest: Adults only. (only paramedics may determine death using trauma arrest criteria)
   ► Blunt trauma arrest
   ► Penetrating trauma arrest
   ► Prolonged extrication (> 15 minutes) with no resuscitation possible during extrication
Exception: Patients with suspected hypothermia will be resuscitated and transported to the closest most appropriate emergency department

2.3 Actions

2.3.1 Immediately notify the coroner and appropriate public safety agency (if not already done) and remain on the scene until they arrive

2.3.2 Complete a Patient Care Report form documenting the above and leave the PCR with the patient at the scene in a safe place. If unable to do so, complete the PCR and fax to Coroner's office (510) 268-7333 as soon as possible, but not later than the end of your shift

2.3.3 Search for a donor card (see page 91)

2.3.4 Rhythm documentation: EKG rhythm strips attached to the PCR, if available

3. DO NOT RESUSCITATE (DNR)

3.1 Authority: Health and Safety Code, Division 2.5, Section 1798. Information contained in this policy is based on "Guidelines for EMS Personnel regarding Do Not Resuscitate Directives", Published by Emergency Medical Services Authority

3.2 Purpose: To establish criteria for field personnel to determine the appropriateness of withholding or discontinuing resuscitative measures based on the wishes of the patient

3.3 Philosophy: Despite pre-planning, 9-1-1 is frequently activated when death is imminent. It is the intent of this policy to honor the wishes of the patient not to perform an unwanted resuscitation by establishing procedures whereby legitimate DNR directives are honored

3.4 Definition: Do Not Resuscitate (DNR) means no:

► assisted ventilation
► chest compressions
► defibrillation
► endotracheal intubation
► cardiotonic drugs

3.5 Approved Prehospital DNR Directives: - The Prehospital DNR form may be an original or a copy. All forms require the patient's signature (or signature of appropriate surrogate) and the signature of the patient's physician to be valid. Field personnel may withhold or discontinue resuscitative measures, if presented with any one of the following:

► A Physician Orders for Life-Sustaining Treatment (POLST) Program form.
► An approved medallion (e.g. “Medic-Alert”) inscribed with the words: "Do Not Resuscitate-EMS”. Call the 800 number on the medallion for access to advanced healthcare directives, including living wills, durable power of health care attorney documents, and organ, tissue, and anatomical gift donation information
► The patient's physician is present on scene and issues a DNR order, or issues a DNR order verbally over the phone to field personnel
► A DNR order signed by a physician in the patient's chart at a licensed health facility.
► An EMSA/CMA “Prehospital Do Not Resuscitate” form

3.6 Medical Treatment of the patient with a DNR or End of Life Act directive: If the patient requests treatment, including resuscitation, the request should be honored. The patient should receive treatment for pain, dyspnea, major hemorrhage, relief of choking or other medical conditions.

► However, if the patient has stopped breathing and is unconscious, the DNR directive should be honored
► Resuscitation should be withheld if there are DNR orders or evidence (e.g. - Final Attestation Form) that the patient is exercising their rights under the End of Life Act.
DEATH IN THE FIELD

3.7 **Patient Identification:** Correct identification of the patient is crucial, but after a good faith attempt to identify the patient, the presumption should be that the identity is correct if proper documentation is present and the circumstances are consistent. A reliable witness may be used to identify the patient, if available.

3.8 **PROCEDURE - With an approved prehospital DNR directive (The POLST form is preferred):**

3.8.1 Field personnel should not start resuscitation. If CPR or other resuscitative measures were initiated prior to the discovery of the DNR directive, discontinue resuscitation immediately.

3.8.2 EMTs cancel the ambulance response.

3.8.3 If the patient is transported, a copy of the DNR directive should go with the patient.

3.8.4 If the patient arrests en route: 1) do not start resuscitation and 2) continue to the original destination.

3.9 **Documentation:**

3.9.1 If resuscitation was started and then discontinued, document the time on the PCR.

3.9.2 A copy of the DNR directive should be attached to the PCR. If a copy is unavailable, document the following:

- The type of DNR directive (e.g.: written in the patient chart at a licensed care facility, issued verbally over the phone)
- The date the order was issued
- The name of the physician

3.9.3 If the patient’s physician issued the DNR order verbally while on scene, document the name of the physician and have the physician sign the PCR.

3.9.4 **Other forms or directives:** Advanced Health Care Directive (AHCD) (enacted in 2000) replaces the California Durable Power of Attorney for Health Care, the California Natural Death Act and living wills; although all of these forms are considered valid. The AHCD contains a section called “Health Care Instructions” that has specific information regarding options selected by the patient regarding resuscitation.

4. **DISCONTINUATION OF CPR**

4.1 CPR may be discontinued:

- If CPR was started prior to the discovery of an approved DNR directive
- Upon further examination the patient meets the determination of death criteria
- Following an unsuccessful resuscitation - paramedics only
- Upon request of an immediate family member or spouse (as specified in section 1.3)

4.2 **Once CPR has been discontinued:** all therapeutic modalities initiated during the resuscitation must be left in place until it has been determined by the coroner's bureau that the patient will not be a coroner's case. This includes equipment such as: airways, endotracheal tubes, IV catheters, monitor electrodes, and personal items including clothing, jewelry etc.

4.3 **If the coroner's bureau releases the body while field personnel are still on scene:**

- Document the name and badge number of the coroner's investigator on the PCR
- Remove and properly dispose of all medical equipment used during the resuscitation attempt
DEATH IN THE FIELD

5. SEARCH FOR A DONOR CARD (Authority: § 7152.5 Health & Safety Code)

5.1 The following persons shall make a reasonable search for a document of gift or other information identifying the bearer as a donor or as an individual who has refused to make an anatomical gift:

► A law enforcement officer upon finding an individual who the officer believes is dead or near death

► Ambulance or emergency medical personnel, upon providing emergency medical services to an individual, when it appears that death of that individual may be imminent. This requirement shall be secondary to the requirement that ambulance or emergency medical personnel provide emergency medical services to the patient

5.2 If a document of gift or evidence of refusal to make an anatomical gift is located by the search required above, the hospital and/or coroner’s bureau (as applicable) shall be notified of the contents and the document or other evidence shall be sent with the patient

5.3 The above search and the results of the search must be documented on the PCR (patient care report)

5.4 A person who fails to discharge the duties imposed by this section is not subject to criminal or civil liability but is subject to appropriate administrative sanctions
## Physician Orders for Life-Sustaining Treatment (POLST)

**First follow these orders, then contact Physician/NP/PA.** A copy of the signed POLST form is a legally valid physician order. Any section not completed implies full treatment for that section. POLST complements an Advance Directive and is not intended to replace that document.

### Patient Information:
- **Patient Last Name:** [ ]
- **Date Form Prepared:** [ ]
- **Patient First Name:** [ ]
- **Patient Date of Birth:** [ ]
- **Patient Middle Name:** [ ]
- **Medical Record #: (optional)** [ ]

### A. Cardiopulmonary Resuscitation (CPR):
- **If patient has no pulse and is not breathing.**
  - [ ] Attempt Resuscitation/CPR (Selecting CPR in Section A requires selecting Full Treatment in Section B)
  - [ ] Do Not Attempt Resuscitation/DNR (Allow Natural Death)

### B. Medical Interventions:
- **If patient is found with a pulse and/or is breathing.**
  - [ ] Full Treatment – primary goal of prolonging life by all medically effective means.
    - [ ] Trial Period of Full Treatment.
  - [ ] Selective Treatment – goal of treating medical conditions while avoiding burdensome measures.
    - In addition to treatment described in Comfort-Focused Treatment, use medical treatment, IV antibiotics, and IV fluids as indicated. Do not intubate. May use non-invasive positive airway pressure. Generally avoid intensive care.
    - [ ] Request transfer to hospital only if comfort needs cannot be met in current location.
  - [ ] Comfort-Focused Treatment – primary goal of maximizing comfort.
    - Relieve pain and suffering with medication by any route as needed; use oxygen, suctioning, and manual treatment of airway obstruction. Do not use treatments listed in Full and Selective Treatment unless consistent with comfort goal.
      - Request transfer to hospital only if comfort needs cannot be met in current location.

### C. Artificially Administered Nutrition:
- **Offer food by mouth if feasible and desired.**
  - [ ] Long-term artificial nutrition, including feeding tubes.
  - [ ] Trial period of artificial nutrition, including feeding tubes.
  - [ ] No artificial means of nutrition, including feeding tubes.

### D. Information and Signatures:
- **Discussed with:**
  - [ ] Patient (Patient Has Capacity)
  - [ ] Legally Recognized Decisionmaker
  - [ ] Advance Directive dated [ ] , available and reviewed
  - [ ] Advance Directive not available
  - [ ] No Advance Directive

### Signature of Physician / Nurse Practitioner / Physician Assistant (Physician/NP/PA)
- **Print Physician/NP/PA Name:** [ ]
- **Physician/NP/PA Phone #:** [ ]
- **Physician/PA License #: NP Cert. #:** [ ]

### Signature of Patient or Legally Recognized Decisionmaker
- **Print Name:** [ ]
- **Relationship:** (write self if patient)
- **Signature:** (required)
- **Date:** [ ]

### Mailing Address (street/city/state/zip):
- [ ]
- **Phone Number:** [ ]

---

*Form versions with effective dates of 1/1/2009, 4/1/2011 or 10/1/2014 are also valid.*
EMS AIRCRAFT TRANSPORT

NOTE: EMS Aircraft utilized in Alameda County for prehospital emergency care will meet the qualifications specified in Title 22, Chapter 8.

1. INITIATING EMS AIRCRAFT RESPONSE

1.1 The decision to request an EMS Aircraft is based on medical and scene management considerations

1.2 Prior to arrival at the scene - An EMS Aircraft may be activated by any responding agency if there may be a potential need for air transport based on the incident type or location of the victim(s)

1.3 All responding agencies shall be notified when an EMS Aircraft has been requested

1.4 When on-scene, the decision to activate an EMS Aircraft shall be made by the IC (Incident Commander or his/her designee), upon:
   - the advice of on-scene medical personnel and/or
   - the suitability of the scene for helicopter operations

2. CONSIDERATIONS FOR REQUESTING EMS AIRCRAFT: (one or more of the following conditions exists)

2.1 Long response times to scene (>20 minutes)

2.2 Inaccessibility to the scene by ground personnel or equipment

2.3 Extended extrication

2.4 Extended transport to an appropriate facility > 20 minutes (e.g. remote area, peak traffic, closest most appropriate facility closed)

2.5 Patients meeting Critical Trauma Patient Criteria (see page 25) with extended transport time to an approved Trauma Center

2.6 Patients requiring advanced skills not in the Alameda County Paramedic scope of practice. (e.g. RSI, Surgically places thoracostomy tubes)

2.7 Patient conditions where a decrease in transport time to an appropriate medical facility may be a significant factor

2.8 Patients in cardiac arrest from drowning or penetrating trauma with a short down time. In general, all other patients with cardiac arrest should not be transported in an air ambulance or rescue aircraft

2.9 A multi-casualty incident exists with a need for increased resources

3. EMS AIRCRAFT DISPATCH

3.1 All EMS Aircraft activations shall be made through ALCO-CMED. ALCO should be given the following information if available:
   - Number of Patients and acuity of each
   - Type and extent of injuries
   - Location of Landing Site (use Thomas Brothers Map coordinates or Longitude and Latitude, if possible)
   - Nearest landmarks (e.g., highways, railroad tracks, water towers)
   - Weather conditions, especially high winds, fog or visibility problems.

4. COMMUNICATION

4.1 ALCO-CMED shall request activation of the EMS Aircraft that has the shortest total response time to the scene/rendezvous site

4.2 The responding EMS Aircraft may contact ALCO on VHF TAC 4 (154.070) while en route to the scene to confirm radio frequency and ground contact/incident identifier
   - The preferred frequency for helicopter to ground unit communications is: CALCORD (156.075)
   - Alternate frequencies are VHF TAC 4 (154.070) and VHF TAC 5 (154.235), but should be
coordinated through ALCO-CMED

► Fire White (154.280) is not authorized for cross patch to an ambulance or helicopter.

4.3 The responding EMS Aircraft will advise ALCO of ETA in minutes and clock hours. ALCO shall advise the requesting agencies of the EMS Aircraft's ETA.

4.4 ALCO shall keep responding/on scene ground personnel updated as to aircraft status (cancellation, delays, inability to respond, etc.).

4.5 If multiple aircraft are responding to the scene or in the area of the incident, ALCO shall attempt to notify each aircraft of multiple aircraft response.

4.6 The EMS Aircraft shall contact the receiving hospital prior to arrival. A patient care report and an ETA should be given.

5. UTILIZATION OF RESCUE AIRCRAFT

5.1 A number of public agencies, including East Bay Regional Park District, California Highway Patrol, Coast Guard and various military units, operate aircraft which are classified as ALS Rescue Aircraft, BLS Rescue Aircraft or Auxiliary Aircraft.

5.2 The decision to transport in a rescue aircraft should be made by on-scene medical personnel and is based on patient condition and availability of other resources.

5.3 Considerations for utilizing rescue aircraft:

► the patient is in an area that is inaccessible to ground transport vehicle,
► the ETA of a ground ambulance and/or Air Ambulance exceeds the loading and lift-off time by the rescue aircraft,
► an air ambulance is unavailable,
► the patient clearly does not require the level of service provided by an air ambulance,
► a rescue requiring the use of a hoist device is indicated.

5.4 When an EMT-P accompanies a patient in a BLS rescue aircraft, the EMT-P must:

► have available all appropriate medical equipment needed to care for the patient;
► receive orientation to the aircraft and to medical air transport procedures according to Title 22, Chapter 8, Section 100302.

6. SAFETY/LANDING - Safety rules at the scene include:

6.1 Landing Zone considerations (L-Z):

► 75' x 75' during daylight, 100' x 100' during night hours,
► clear of cross wires, debris, or other obstacles, relatively flat
► Consult CHP/Law Enforcement when landing on roadways.

6.2 Ground personnel should coordinate with public safety agency for road closures, if necessary.

6.3 The fire department should determine the landing zone and assure scene safety during landing.

6.4 Before clearing EMS aircraft to land the IC must ensure that the helicopter will not block the transport of patients out of the scene by ground. If ground transport will be blocked then the IC must make sure that ground units with critical patients have departed before clearing aircraft to land.

6.5 The pilot in command shall have the final authority as to the safe operation of the air transport. If, in the pilot's judgment, patient transport by an EMS aircraft would be unsafe, regardless of the patient's condition, the patient should be transported by ground ambulance.

6.6 Ground personnel shall not approach the aircraft unless directed to do so and accompanied by the aircraft crew.

6.7 Regardless of how the request was initiated, only the IC shall authorize the landing of a helicopter at
the scene. Coordination between medical personnel and the IC is essential

7. CANCELING EMS AIRCRAFT RESPONSE

7.1 Ground transport should be utilized if:
   ► the overall prehospital time will not be decreased by the use of air transport and/or
   ► the patient does not meet criteria identified in Section 3 for Requesting EMS Aircraft.

7.2 Regardless of how an EMS Aircraft activation was initiated, only the IC shall cancel the response. The IC will cancel the EMS Aircraft response if so advised by on-scene medical personnel (see 9.1 below). Coordination among all medical personnel and the IC is essential.

7.3 The IC should only cancel an EMS Aircraft response if on-scene and aware of the patient’s condition.

7.4 EMS Aircraft response can be canceled by:
   ► notifying ALCO, who will then notify all responding agencies
   ► the IC if in contact with the responding Aircraft

7.5 The IC shall be immediately advised of the decision to transport by ground.

7.6 If the EMS Aircraft arrive on scene prior to the ground ambulance, the responding ground ambulance shall not be canceled until:
   ► the EMS Aircraft has left the scene with the patient aboard; and,
   ► it is determined by the IC or his/her designee that there are no additional patients to be transported.

8. TRANSPORT

8.1 The transporting ALS provider shall have authority and responsibility to determine mode of patient transport (air vs. ground) and patient destination. The transporting ALS provider must consult with first responder personnel and EMS Aircraft crew, if applicable, prior to making this decision.

8.2 Alameda County transport policies shall be followed for all patients requiring air transport. Patients shall be transported to the closest hospital most appropriate for the medical needs of the patient with an approved Helipad or EMS Landing Site.

8.3 Trauma Centers with approved helipads or emergency landing sites are:
   ► Eden Hospital (Castro Valley)
   ► Children’s Hospital (Oakland)
   ► John Muir Hospital (Walnut Creek)
   ► Highland General Hospital (Coast Guard Island)
   ► Regional Medical Center (San Jose)
   ► Valley Medical Center (San Jose)
   ► Stanford University Hospital (Palo Alto)

8.4 Alameda County Receiving Hospitals with approved helipads or emergency landing sites are:
   ► Eden Hospital
   ► Washington Hospital
   ► Valley Care Medical Center
   ► Children’s Hospital

9. PATIENT CARE RESPONSIBILITIES

9.1 Transfer of care shall occur:
   ► upon arrival/landing of the responding personnel at the scene when patient contact is made.
   ► after a verbal patient care report is given to the transporting agency in accordance with page 146, "Transfer of Care".

9.2 The EMS Aircraft crew may release the patient to an ALS ground transport unit if ground transport is
determined appropriate

9.3 The EMS Aircraft or ALS ground ambulance crew may release a patient to BLS rescue aircraft if the patient does not require ALS care but air transport is determined to be appropriate.

10. DOCUMENTATION - Appropriate documentation must be completed on all patients transported by the EMS Aircraft crew and faxed immediately to ALCO EMS at (510) 618 – 2099

11. REQUEST FOR MILITARY AIRCRAFT

11.1 Military assistance may be used when non-disaster inland search and rescue operations may exceed local and state capabilities. Examples: water rescue, rescue in inclement weather, hoist rescue

11.2 One hour response time minimum time should be expected. An ETA can only be given after the request is made and an assessment of available resources has been completed

11.3 If hoist rescue requested do not place the patient on a stretcher or stokes basket, although the patient may be placed on a backboard. The hoist equipment requires specialized equipment

11.4 The incident commander determines the need for military aircraft and contact ALCO with the following information:

► Incident location and longitude and latitude if known
► Incident description including the number of injured, types of injuries and topography
► If a hoist is requested, an estimate of the distance the patient will need to lifted from the ground to the aircraft
► Altitude of incident if known
► Air to ground contact frequencies

11.5 Notification Procedure - ALCO:

► For maritime rescue: call Coast Guard Dispatch directly at (415) 556-2105 or (415) 556-2103
► For land (non-maritime) rescue or assistance call:
  ➔ State OES Law Division at (800) 852-7550 for approval
  ➔ Coast Guard dispatch (415) 556-2103 to give the Coast Guard helicopter flight crew an advanced notification. Since the Coast Guard’s primary responsibility is maritime search and rescue, they can notify ALCO of their availability

11.6 If additional information is needed, ALCO will direct the questions to the requesting IC’s dispatch center for direct contact.
EQUIPMENT AND SUPPLY REQUIREMENTS AND INSPECTION

1. **EQUIPMENT AND SUPPLIES:** The provider agency is responsible for providing a full inventory of equipment and supplies to its units.

2. All ALS and BLS patient care response vehicles (transporting and non-transporting) shall have at a minimum, all equipment and supplies specified in "Equipment and Supply Specifications - ALS/BLS" (page 98). This policy does not supersede the California Vehicle Code or California Code of Regulations, Title 13 requirements for ambulance equipment. In addition, each patient care response vehicle shall have:
   
   2.1 Adequate space in the patient care compartment to accommodate one stretcher, a patient(s) and two providers. There must be sufficient space to allow for patient care activities during transport.
   
   2.2 County approved communications equipment capable of contact with receiving hospitals, base hospitals, and other provider agencies during an MCI or mutual aid situation.
   
   2.3 Personal protective equipment in accordance with Cal/OSHA standards.

3. Each ALS provider (transport and non-transport) shall have an approved controlled substance/medication restock procedure on file with the EMS Agency.

4. **INSPECTION:** Alameda County EMS Agency personnel may inspect any BLS, CCT and/or ALS mobile unit at any time for compliance with the identified standards for equipment and personnel – see “Equipment and Supply Specifications - ALS/BLS" page 98.
   
   - Deficiencies may result in the unit's removal from service until the deficiencies are remedied.
   - The Alameda County EMS Agency will notify the service provider agency's designated management representative immediately of the infraction.

**NOTE:** Dual-chamber autoinjectors (e.g. - DuoDote®) may be substituted for individual doses of atropine and pralidoxime.

#### Bags for Infusion

- **Dw 500mL**: 1 |
- **Dw 100mL**: 1 |
- **Normal Saline (NS) 1,000mL**: 2 |

#### For use only by Paramedics as Members of Medical Hazmat Teams

- Atropine Sulfate 2 mg (for nerve agent exposure): 60 doses |
- Pralidoxime chloride: 20 doses
1. PHILOSOPHY

1.1 The intent of this policy is to provide grief support to the families of deceased individuals who are not transported from the field. Grief Support will be available to assist families in dealing with the death of a family member.

1.2 Field personnel should identify the need for grief support as soon as possible, especially for an unexpected death or if considering discontinuation of CPR in the field.

1.3 Field personnel should follow their agency/department procedure for initiating grief support.

2. RESPONSIBILITIES

2.1 Assist the family in dealing with the death, or anticipated death, of the patient.

2.2 If resuscitation is in progress determine if the family wants the patient transported to the hospital.

2.3 Once death has been determined:

► remain on scene with the family to provide support and assist with decisions
► contact all appropriate agencies (e.g. Police, Coroner) if not already done
► remove all medical equipment used during the resuscitation if cleared by the Coroner’s bureau (see "Death in the Field - Discontinuation of CPR" page 90).
► assist with the notification of clergy, if requested
► provide information regarding the disposition of the remains

3. GRIEF SUPPORT GUIDELINES:

Breaking the News. . .

• Physically join the family.
• Introduce yourself.
• Go over with the family what has been done, what interventions have been tried.
• “The paramedics (we) found your [husband, wife, daughter, etc.] not breathing. We began CPR. I am very sorry to tell you but your [husband, wife, daughter, etc.] has died.”
• Give the family time to react don’t leave.

Grief Support Skills

• Ask the family if there is someone they would like you to call. Find a neighbor.
• Things to say:
  ► “Mrs. Smith, tell me what happened today”
  ► “I am sorry Joe has died.”
  ► “This is a difficult time, it is OK to cry”
  ► “You may not remember all I have said right now and that’s OK.”
  ► “I will be available later to talk to you”
  ► “I don’t know but I will find out”
• Remember: You cannot fix grief. Just give it an honest and safe place to exist.
• Give the family the grief support brochure.

Tell the family what happens next

• The coroner must be notified (Paramedics and/or police to do this)
• Ask if the family has selected a mortuary.
• Get the private doctors name and as much patient history as possible (including medications that indicate specific medical conditions)

Coroner’s Case

• Cause of death must be investigated.
• Investigator can explain more.
• Police must stay if a coroner’s case. (may choose to stay until mortuary arrives if not a coroner’s case)
• Mortuary will pick up at coroner’s office.
• Explain scene preservation nothing may be moved or disturbed.

Mortuary Case

• Family should choose and call a mortuary.
• Ask family/friends/church for suggestion.
• Mortuary will come to the scene.
• Remove and dispose of all medical equipment.
• Body may be left with family if they are OK and not a coroner’s case. Ask how they feel.

Knowing when to Leave

• Tell them it is time for you to go “is there anything else I can do?”
• Go through the grief support brochure, point out referral numbers. Give them your card or how they can reach you.
• Offer your condolences shake hands or touch if appropriate.
• Leave
INTERFACILITY TRANSFERS

Note: This policy pertains to emergency transfers to a higher level of care that come through the 9-1-1 system. See "Scheduled Interfacility Transfers Using Paramedic Personnel" (policy #4605 Administration Policy Manual) for more information.

1. All patient care rendered by prehospital care personnel must be within the defined scope of practice according to Title 22 and Alameda County EMS protocols

2. A paramedic may only take orders from a base hospital physician. (See 5.2 below) There are no provisions for an EMT-1 to take orders from a physician

3. EMT-Bs may only transfer a patient without an emergency medical condition; or, with an emergency medical condition that has been stabilized and has no potential (within reasonable probability) to deteriorate en route

4. Paramedics (in addition to 3) may only transport a patient who has not been stabilized to a facility that provides a higher level of care. The transferring physician must determine if the care that may be required during transport is within the scope of practice of a paramedic. If not, appropriate hospital staff and/or equipment should be sent with the patient

5. Base Contact by Paramedics

5.1 **Base Contact is required prior to transport** if the transferring physician orders any ALS treatment and/or the patient has not been stabilized

5.2 Paramedics may follow transferring physician's written orders ONLY when 1) the transferring physician speaks to the Base Physician, and they mutually agree on the course of treatment; 2) the proposed treatment plan is within the paramedic's scope of practice

5.3 **Base Physician contact shall be made:**

   ► When there is a request to transfer a patient to a higher level of care facility that is not the "closest" higher level of care facility.

5.4 **Base Contact is not required** if the patient is stable and no ALS treatment has been ordered by the transferring physician. If the patient's condition changes during transport see the appropriate patient care policy and treat accordingly

6. Base Contact may be made anytime a paramedic has a question regarding patient condition, destination and/or the appropriateness of the transfer

7. An Alameda County Unusual Occurrence (U.O.) form should be completed for any problem-oriented interfacility transfers. The U.O. form should be sent to the EMS office for review. [See Administration Manual UNUSUAL OCCURRENCES (#2300)]

8. Refer to “Interfacility Transfer Guidelines” [see Administration Manual INTERFACILITY TRANSFER GUIDELINES (# 5600)] for transfer approval process
IV LINES & DEVICES, VENTILATORS & OTHER PATIENT CARE EQUIPMENT

1. PURPOSE: To define the scope of practice of the EMT-1 and paramedic with respect to the management of patients during emergency or routine transport from the field or during an interfacility transfer

2. Certified EMT-1 or a supervised EMT-1 student may:

► Assist patients with the administration of physician prescribed devices, including but not limited to, patient operated medication pumps, sublingual nitroglycerin, and self-administered emergency medications, including epinephrine devices
► Monitor intravenous lines delivering glucose solutions or isotonic balanced salt solutions including Ringer’s lactate for volume replacement;
► May monitor, maintain, and adjust if necessary in order to maintain, a preset rate of flow and turn off the flow of intravenous fluid;
► May transfer a patient, who is deemed appropriate for transfer by the transferring physician, and who has nasogastric (NG) tubes, gastrostomy tubes, heparin locks, foley catheters, tracheostomy tubes and/or indwelling vascular access lines, excluding arterial lines
► May Monitor preexisting vascular access devices and intravenous lines delivering fluids with additional medications pre-approved by the Director of the EMS Authority

3. Licensed Paramedics, in addition to the above may:

► Monitor and administer medications through pre-existing vascular access
► Monitor and adjust IV solutions containing potassium equal to, or less than, 20 mEq/L
► Transport and monitor a patient that has fluid and/or medication running through a central line, central venous access device, or heparin lock as long as the medications are within the paramedic scope of practice. Medications not included in the paramedic scope of practice may not be administered during transport. (12/21/05)

4. Infusion Devices - An EMT-1 or Paramedic may transport a patient with an infusion device under the following conditions:

► The transport is authorized, in writing, by the patient's physician or is approved by the Base Hospital physician
► For BLS transport - the patient must be stable, non-critical and the purpose of the transport must be of a routine nature, such as a pre-scheduled appointment to a medical facility for examination or treatment (e.g. dialysis, chemotherapy, doctor's office visit)
► Paramedics should transport the patient if the reason for the transport is a change in condition or a new medical complaint
► The patient or trained family member must be present to monitor and regulate the device during the transfer, without any assistance from the EMT-1 or paramedic
► If any doubt exists as to the ability of the patient or family member to manage the device or the device is not functioning properly, the patient should be assessed by ALS personnel and if appropriate, consultation with the Base Physician should be obtained

5. Ventilators:

► If during a response to a 911 or scheduled interfacility transport, an EMT – I discovers a patient on a ventilator that requires transport, a CCT – Paramedic or CCT – RN response shall be initiated
► Paramedics may disconnect the patient from the ventilator and assist ventilation using a bag-valve device. If it is in the best interest of the patient to remain on a ventilator during transport and a delay in transport will not compromise patient care or comfort, a CCT – Paramedic or CCT – RN response shall be initiated. If any doubt exists regarding the condition of the patient, the Base Physician should be consulted

6. Thoracostomy tubes: Only CCT - Paramedics may monitor thoracostomy tubes
MEDICAL PERSONNEL ON THE SCENE

1. **MEDICAL PERSONNEL ON THE SCENE** (non-physician) - If a bystander at the scene of an emergency identifies him/herself as a medical person, other than a physician, the First Responder or paramedic should:
   
   1.1 Inform the individual that they may assist the emergency response team and/or offer suggestions, but may not assume medical management for the patient
   
   1.2 Maintain overall scene management

2. **PHYSICIAN ON THE SCENE** - If a bystander at an emergency scene identifies him/herself as a physician:
   
   2.1 BLS responder will work in conjunction with the physician until the arrival of ALS.
   
   2.2 Paramedics should:
      
      ► give the physician a "Note to Physicians on Involvement with EMT-1s and Paramedics" card. (available at the EMS Office or on the EMS website.) The document below is a representation of the actual card)
      
      ► determine the alternative the physician has chosen (1, 2, or 3 on the card below)

---

**STATE OF CALIFORNIA**

**CALIFORNIA MEDICAL ASSOCIATION**

**NOTE TO PHYSICIANS ON INVOLVEMENT WITH EMT-1s AND PARAMEDICS**

A life support team (EMT-1 or Paramedic) operates under standard policies and procedures developed by the local EMS agency and approved by their Medical Director under Authority of Division 2.5 of the California Health and Safety Code. The drugs they carry and procedures they can do are restricted by law and local policy.

If you want to assist, this can only be done through one of the alternatives listed on the back of this card. These alternatives have been endorsed by CMA, State EMS Authority, CCLHO and BMQA.

Assistance rendered in the endorsed fashion, without compensation, is covered by the protection of the Good Samaritan Code@ (see Business and Professional Code, Sections 2144, 2395-2298 and Health and Safety Code, Section 1799.104).

(REV. 7/88) 88 49638 Provided by the EMS Authority

**ALTERNATIVE #1** - If the physician on scene chooses alternative #1, the physician should assist the paramedic team or offer suggestions but allow the paramedics to provide medical treatment according to County protocol

**ALTERNATIVE #2 or ALTERNATIVE #3** - If the physician on scene chooses alternative #2 or #3 the paramedics should ask to see the physician's medical license, unless the physician is known to the paramedics. Contact the Base Physician and have the physician on scene speak directly with the Base Physician

3. **BASE HOSPITAL PHYSICIAN RESPONSIBILITY** - After speaking to the physician on scene, the Base Physician should evaluate the situation and decide which of the available alternatives is in the best interests of the patient. These alternatives include:
   
   3.1 retain medical control and request the physician on scene to assist the paramedics and/or offer suggestions only (alternative #1); or,
   
   3.2 retain medical control but consider suggestions offered by the physician on scene (alternative #2); or,
   
   3.3 delegate medical control to the physician on scene (alternative #3)
MEDICAL PERSONNEL ON THE SCENE

4. PARAMEDIC RESPONSIBILITY

4.1 Alternative #1 or #2:
   ► Maintain medical control of the patient and provide medical treatment according to County Protocol

4.2 Alternative #3:
   ► ALS equipment and supplies should be made available to the physician. Offer assistance as needed
   ► The physician must go with the patient in the ambulance to the receiving hospital
   ► Document all care rendered to the patient on the PCR and ensure that the physician signs for all instructions and medical care given
   ► If appropriate, maintain communication with the Base Hospital or recontact if any problems arise

5. An EMS Unusual Occurrence Form shall be completed:

5.1 On any Physician or Medical Personnel on-scene calls if there was a problem associated with care rendered

5.2 For physician on-scene call if Alternative #3 was chosen (paramedics only)
ON VIEWING AN ACCIDENT - NON-CONTRACT AMBULANCE

1. **INTRODUCTION:** Ambulance response to the scene of a motor vehicle accident shall only be dispatched through County Dispatch (ALCO-CMED 925-422-7595). If a non-contract ambulance company is called to respond to an accident, the dispatcher should immediately call County Dispatch to initiate the appropriate public safety and ambulance response.

2. **Ambulance First on Scene**
   
   2.1 If an ambulance unit witnesses an accident, the accident should be reported to their dispatch for initiation of appropriate public safety and/or emergency ALS ambulance personnel.
   
   2.2 If there are no first responders on scene and the crew is not en route to a medical emergency or transporting a patient code 3, they should stop to ascertain if there are injuries. If there are injuries, they are to render appropriate care within their scope of practice.
   
   2.3 If an emergency ALS ambulance has already been dispatched, the ambulance should not transport unless the delay might jeopardize the patient. The decision to transport should be made based upon the patient's condition and the estimated time of arrival (ETA) of the emergency ALS ambulance.
   
   2.4 If an emergency ALS ambulance has not been dispatched but the patient's condition is such that immediate transport is not required, the crew should request County Dispatch to dispatch an emergency ALS ambulance.

3. **Public Safety on Scene (police, CHP, fire) but no Ambulance Personnel**
   
   3.1 Stop to ascertain if assistance is required. The crew should notify the officer on-scene that they have not been dispatched to this call.
   
   3.2 If an emergency ALS ambulance is not on the scene, medical authority rests with the most medically qualified responder. The decision to wait for an emergency ALS ambulance or to authorize transport by the ambulance is the responsibility of the most medically qualified responder, who should consider the condition of the patient, whether an ambulance has been requested through County Dispatch and the ETA of the emergency ALS ambulance.
   
   3.3 If the emergency ALS ambulance arrives on scene, medical authority rests with the personnel of the emergency ALS ambulance. This individual(s) should determine if assistance from the on-viewing ambulance is required.

4. **Responsibility of an Ambulance Transporting from Scene**
   
   4.1 If the ambulance transports a patient(s) from an accident scene in accordance with this policy, and no other patients remain at the scene, County Dispatch should be immediately informed so that any additional responding units may be cancelled.
   
   4.2 The transporting ambulance should notify the receiving hospital emergency department by radio, cellular phone, or through their dispatch of their imminent arrival (see page 137).
   
   4.3 A patient care report on the patient’s condition and treatment should be left at the emergency department. A copy of the report and an unusual occurrence form explaining the circumstances of the transport shall be submitted to the county within ten (10) days.
PARAMEDIC FIELD SUPERVISORS - UTILIZATION OF ALS SKILLS

1. **PURPOSE:** To allow Paramedic Field Supervisors to utilize ALS skills, within their scope of practice, while functioning in the role of Field Supervisor.

2. Paramedic Field Supervisors must carry all of the ALS equipment authorized in Alameda County as per policy.

3. Paramedic Field Supervisors must be able to perform all ALS procedures authorized in Alameda County as per policy.

4. Each ALS provider agency planning to use Paramedic Field Supervisors in the role of caregiver must develop policies and procedures to assure that appropriate equipment and supplies are stocked and checked.

5. In all instances, if a Paramedic Field Supervisor initiates any ALS procedure or administers any medications, prior to the arrival of an ALS unit, he/she must assist with documentation on the PCR and sign the bottom of the PCR as a team member.

6. The paramedic Field Supervisor may transfer the care of the patient to the arriving ALS unit after giving a report.

7. The paramedic Field Supervisor will not be required to accompany the patient to the hospital unless requested to by the arriving ALS unit.
**Note:** Possible medical causes of delirium include: neurologic disorders, environmental causes, infections, cardiovascular disorders, metabolic and endocrine disorders.

*Note:* Psychiatric etiologies include: psychosis, schizophrenia, severe depression, bipolar disorder, anxiety disorder.

**Behavioral Crisis**

- **Psych etiology?**
  - Yes
  - Is behavior due to developmental disability and/or are there other resources available?
    - Yes
      - Transport to appropriate psychiatric facility. See page 113
    - No
      - Consider Sedation (See page 138)
  - No
  - Commonly encountered developmental disabilities: autism, Down syndrome, mental retardation

**Considerations:**

- Involve Care Givers. Allow them to ask questions and participate in physical assessment.
- Attempt to discover event trigger. Event may resolve if solution to trigger is implemented.
- Determine level of language/communication.
- Assessment from feet to head.
- Utilize simple language, even vocal tone, and be aware of body language and threatening physical gestures.
- If transport is necessary allow caregiver to ride in with the patient.
1. **GENERAL INFORMATION:** Any patient who has been, or will be (e.g. - self-committal) placed on a 5150 hold for psychiatric evaluation shall be assessed and transported according to this policy. For minors (age below 18) the hold is called a 5585 hold and is similar to 5150 hold

2. **MEDICAL CLEARANCE CRITERIA:**

   2.1 **Age 65 and Above:** Patients with or without acute medical issues, should be transported to the closest most appropriate receiving hospital for evaluation

   2.2 **Age 12 to 64:**

   2.2.1 Transport patients to a closest most appropriate receiving hospital* if there is a suspected acute medical or traumatic condition requiring emergent or urgent attention in an Emergency Department. Patients with these conditions include:

       ➤ Patients “in extremis” (those with a potential life-threatening illness or injury)
       ➤ Patients who are unconscious, unresponsive, have chest or abdominal pain, significant bleeding, or suspected shock
       ➤ Patients who shows signs of potential significant toxicity from illicit drugs or alcohol, which may include the following findings:

           ► depressed mental status
           ► inability to ambulate
           ► diaphoresis, agitation
       ➤ Patients with combative behavior who require field sedation with midazolam or whose combativeness prevents assessment (vital signs or examination)
       ➤ Patients with abnormal vital signs or findings:

           ► Systolic blood pressure over 190 mm/Hg or diastolic blood pressure over 110 mm/Hg
           ► Pulse rate sustained over 120
           ► Blood glucose under 60 mg/dL or over 250 mg/dL

       ➤ Patients with a suspected overdose of medication

   2.2.2 Adult patients on 5150 who do not meet medical clearance criteria (see 2.1 and 2.2) should be transported to John George Pavilion, San Leandro. These include:

       ➤ Patients with history of use of drugs or alcohol who do not show signs of significant toxicity
       ➤ Patients with abnormalities in vital signs, but without other significant physical findings or history suggesting an acute medical problem (systolic BP up to 190, diastolic BP up to 110 and pulse up to 120)
       ➤ Patients with minor abrasions or contusions (not needing laceration repair or other complex care or evaluation)
       ➤ Patients who otherwise appear healthy but have communication barriers due to language or developmental disability, or are unwilling to answer questions

   2.3 **Adolescents Age 12 to 17**

   2.3.1 Criteria for transport to the closest most appropriate receiving hospital for medical clearance listed above (2.2.1) for adults also apply to adolescent patients on 5585 (5150) holds

   2.3.2 Additionally, adolescent patients with the following findings should also be transported to receiving hospitals:

       ➤ Patients who have been outside of adult supervision/control for more than 24 hours
       ➤ Patients with recent vomiting over a prolonged period or who report no food or fluid intake for 16 hours or more
       ➤ Patients with known severe chronic medical conditions

   2.3.3 Adolescent patients who do not meet medical clearance criteria (see 2.2) should be transported to Willow Rock Center, San Leandro. Notify Willow Rock en route (510) 895-5502

   2.4 **Children Age 11 and Under**

       ➤ All children age 11 and under on a 5585 (5150) hold should be transported to Childrens Hospital Oakland unless there is a need to divert to another hospital because of medical instability

**NOTE:** Additional considerations for most appropriate facility are listed in the Transport Guidelines and Abuse/Assault Policies
RESPONDING UNITS - CANCELING/REDUCING CODE

1. GENERAL PRINCIPLES: In general, it is better to respond with more personnel and equipment than is needed and cancel them en route, than fail to dispatch appropriate personnel and equipment. Fire and ambulance units should be dispatched to all accident scenes when there is a report of people trapped or injured.

2. CANCELING/REDUCING THE CODE OF RESPONDING UNITS: Medical personnel first on the scene of an incident:

2.1 **may cancel a responding ambulance unit** upon determination that, in the best judgment first responder, the incident does not involve an injury or illness. The ambulance should not be canceled if the patient is requesting care and transport, even if there is no apparent illness or injury.

2.2 **should cancel the ambulance response** if the patient meets the "Determination of Death" criteria or the patient has a valid Alameda County or California Medical Association (CMA) "Do Not Attempt Resuscitation" form (see "Death in the Field" page 88).

2.3 **should reduce a responding ambulance from Code 3 to Code 2** upon determination that, in the best judgment of the First Responder/Officer, the illness or injury is not immediately life threatening or that the difference in Code 3 and Code 2 response time would not likely have an impact on patient outcome.

   **Note:** MPDS guidelines apply

2.4 **Ambulance personnel arriving first on the scene** of a medical emergency should cancel the First Responder/Law enforcement response only if assistance is not needed and a potential public safety risk does not exist at the emergency scene.
RESTRAINTS

1. Patient restraints are to be utilized only when necessary and in those situations where the patient is exhibiting behavior deemed to present danger to him/herself or to the field personnel. When restraints are used:

   1.1 The minimum restraint necessary, to accomplish necessary patient care and safe transportation, should be utilized

   1.2 Circulation to the extremities (distal to the restraints) will be evaluated q 5 minutes

   1.3 The restraints must not be placed in such a way as to preclude evaluation of the patient's medical status (e.g. airway, breathing, circulation) necessary patient care activities, or in any way jeopardize the patient medically

2. If the patient is under arrest and handcuffs are applied by law enforcement officers:

   2.1 The patient will not be cuffed to the stretcher and a law enforcement officer shall accompany the patient in the ambulance, if the handcuffs are to remain applied

   2.2 A law enforcement officer may elect to follow the ambulance in a patrol car to the receiving facility if the patient has been restrained on the gurney using leather restraints

1. **AIRWAY CHECKLIST**

1.1 **Airway Checklist Purpose:** To accurately assess and provide for airway patency from initial patient contact to turnover of care

1.2 **Airway Definition:** The airway extends from the nose and mouth to the alveolar ducts where oxygen and carbon dioxide are exchanged. If the exchange of these gases is impeded at any stage, the patient’s airway is compromised

1.3 **Airway Checklist Indications:** Indicated for patients with or at risk for airway compromise. This includes:
   - Cardiac/Respiratory Arrest
   - Shortness of breath with visible distress
   - Significant tachypnea/bradypnea <10 >30 (adults)
   - Patients who cannot protect their own airway
   - ALTE
   - Respiratory depression after receiving sedation or pain management
   - Patients treated with an airway adjunct, BVM, suctioning or CPAP for airway compromise

1.4 For all patients whom the airway checklist is indicated, use the checklist concurrently with patient care. Thoroughly document all airway checklist components (initial assessments, reassessments and interventions) in the appropriate fields in the PCR

1. **INTRODUCTION:** The approved airway management procedure for the adult consists of endotracheal intubation, or insertion of a supraglottic airway device.

***Nasotracheal intubation is NOT an approved skill in Alameda County***

1.1 The preferred method of airway management for the pediatric patient age 12 and under is bag-valve-mask (BVM) ventilation. (see page 77 Routine Medical Care) **Intubation in this age group should be performed only if BVM ventilation is unsuccessful or impossible**

1.2 ALS personnel are authorized to perform the skill of endotracheal intubation and insertion of a supraglottic airway. **NOTE: A supraglottic airway is defined as an airway device that rests in the pharynx when properly positioned (e.g. – King-LTD®)**

1.3 BLS personnel are authorized to perform the skill of insertion of a supraglottic airway only after completing an approved training program and with the approval of the EMS medical director. BLS personnel may not intubate

1.4 **Defer advanced airway insertion rather than interrupt chest compressions in the cardiac arrest patient. If after 2 minutes of continuous chest compressions and BVM support an immediate endotracheal airway can not be obtained, consider use of supraglottic airway**

1.5 ALS and BLS personnel must confirm tube placement (ET or supraglottic airway) with capnography/capnometry or a colorimetric EtCO₂ device, auscultation and physical assessment (auscultation, observation of chest rise, visualization of the tube passing through the cords, etc.). See #4 below. **NOTE: It is no longer required to use an EDD as a confirmation device. Capnography/capnometry is a far more accurate confirmation tool that negates any value the EDD provided in the past**

2. **INDICATIONS:**

2.1 Non-traumatic cardiac and/or respiratory arrest

2.2 Traumatic cardiac and/or respiratory arrest or severe ventilatory compromise where the airway cannot be adequately maintained by BLS techniques

3. **APPROVED ADVANCED AIRWAY MANAGEMENT PROCEDURE:**

3.1 **Endotracheal intubation - (ALS only)**

3.1.1 **Definition:** An intubation attempt is defined as the insertion of the laryngoscope blade into the patient's mouth

3.1.2 Make no more than 2 total intubation attempts per patient. Each attempt should not last longer than 30 seconds. Ventilate with 100% oxygen for one minute prior to each attempt

3.1.3 If patient has a Cormack-Lehane* grade of 3 or 4 (epiglottis is not or is barely visible), consider primary use of a supraglottic airway

3.1.4 **Note:** If you are unable to maintain respirations using a BVM device in a pediatric patient, intubate (see 1.2 above)

---

*Cormack-Lehane scale*
3.2 **Supraglottic Airway Device (King-LTD®)**

3.2.1 **Definition:** An supraglottic airway attempt is defined as the insertion of the supraglottic airway device into the patient’s mouth.

3.2.2 A supraglottic airway (King-LTD®) device may be placed as a primary airway or after unsuccessful attempt(s) at endotracheal intubation. (ALS only)

3.2.3 The King-LTD® comes in three sizes:

- **Size 3** (height: 4 ft. – 5 ft.)
- **Size 4** (height: 5 ft. – 6 ft.)
- **Size 5** (height: > 6 ft.)

3.2.4 Do not use the King-LTD® in persons < 4 feet tall

3.2.5 Use a laryngoscope or tongue blade to facilitate placement

3.2.6 Remove and replace the King-LTD® if resistance is met

4. **CONFIRM TUBE PLACEMENT:** To be used on an endotracheal tube and the King-LTD® device in the order stipulated below

4.1 **Attach an end tidal CO2 detector (EtCO₂)**

   - **Waveform capnography/ capnometry is preferred and must be used if available**
   
   - If capnography/ capnometry is not available, use an approved colorimetric EtCO₂ device (e.g. – Easy Cap®) until capnography/ capnometry becomes available
   
   - EtCO₂ detector must remain in place until transfer of patient care at the hospital

4.2 **Auscultate** both lung fields for breath sounds, confirm chest rise with ventilation. Listen over left upper quadrant of the abdomen for air in the stomach

---

**All devices used to confirm tube placement must be documented on the PCR**

- ✔ End tidal CO₂ detector (EtCO₂)
- ✔ Capnography/ capnometry
  
  - Describe waveform (e.g. - box, shark fin, straight line, bumpy line, etc.)
  
  - Specify capnometry number in mmHg (e.g. - 15 mmHg)
- ✔ Colorimetric EtCO₂ device (include the color of litmus paper)
- ✔ Visualization, auscultation, chest rise

---

5. If there is any doubt as to proper placement of the endotracheal tube, visualize the pharynx and vocal cords with laryngoscope and use capnographic waveform to make decision. If still in doubt, suction the patient, deflate the cuff, remove the endotracheal tube and replace with a supraglottic airway. (Be prepared - removal of an ET tube may induce vomiting). Ventilate between attempts with 100% oxygen

6. If the patient regains consciousness while intubated, do not extubate. Use restraints as necessary to prevent uncontrolled extubation. Consider Sedation (see Sedation page 138)

7. **If the patient has a suspected spinal injury:**

   - Open the airway using a jaw-thrust without head extension
   
   - If airway can not be maintained with jaw thrust use a head-tilt/chin-lift maneuver
   
   - Manually stabilize the head & neck rather than using an immobilization device during CPR
CONSENT AND REFUSAL GUIDELINES

1. INTRODUCTION:
   1.1 Competent adults may refuse EMS care and/or transportation
   1.2 All potential patients at the scene of an EMS system call must be offered medical care/transport
   1.3 Consent to treat and/or transport may be actual, expressed, or implied (the patient is unable to give consent but is in need of medical attention - e.g., an unconscious patient)
   1.4 If the individual consents, treat only according to the scope of the consent. Competent adults can give partial consent, (e.g., transportation without treatment). There is no legal duty to provide unwanted treatment or transportation

2. PATIENT DEFINITION:
   2.1 The definition of ‘patient’ is any individual that:
       ▶ Has a complaint suggestive of potential illness or injury
       ▶ Requests evaluation for potential illness or injury
       ▶ Has obvious evidence of illness of injury
       ▶ Has experienced an acute event that could reasonably lead to illness or injury
       ▶ Is in a circumstance or situation that could reasonably lead to illness or injury

Is the individual defined as a patient?
(Refer to 2.1 above)

YES
Continue to section 3
Refusal of Care

NO
Skip to section 7
Refusal of Service

Note: ALS Personnel only

Note: BLS and ALS personnel may honor a Refusal of Service

NOTE TO BLS PERSONNEL: If the individual is defined as a patient and is refusing care, the patient requires an assessment by an ALS provider. Treat as necessary while awaiting the arrival of ALS personnel.
CONSENT AND REFUSAL GUIDELINES

3. **REFUSAL OF CARE** - applies to patients who by direct examination, mechanism of injury, or by initiating a patient relationship by dialing 9-1-1 for medical care for themselves, are refusing medical care/transportation. **Only ALS personnel may honor a refusal of care**

3.1 In order to refuse care a patient must be legally and mentally capable of doing so by meeting all of the following criteria:

3.1.1 Is an adult (18 or over), or if under 18 legally emancipated

3.1.2 Understands the nature of the medical condition, and the risks and consequences of refusing care

3.1.3 Exhibits no evidence of:
► Altered level of consciousness
► Alcohol or drug ingestion that impairs judgment

3.1.4 Is oriented to Person, Place, Time, and Situation

3.2 Actions:

3.2.1 **If the patient is legally and mentally capable of refusing care:**
► Honor the refusal
► Document thoroughly. Complete a PCR and a “Refusal of Care” form

3.2.2 **If the patient cannot legally refuse care or is mentally incapable of refusing care:**
► Document on the PCR to show that the patient required immediate treatment and/or transport, and lacked the mental capacity to understand the risks/consequences of refusal. (implied consent)
► Treat only as necessary to prevent death or serious disability and transport
► Do not request a 5150 hold unless the patient requires a psychiatric evaluation

4. **BASE CONTACT:** A refusal of care may be against the advice of the EMS responders and/or the base hospital physician (AMA); however, a competent adult has the legal right to refuse care. For patients with acute conditions (see 4.1.2 and 4.1.3 below) every effort should be made to convince the patient to be transported. Be persuasive - get help from:
► Family members, friends, etc.
► The Base Physician
► Consider calling law enforcement especially if the patient is a child

4.1 **Paramedics should contact the Base Physician:**

4.1.1 For any patient being treated and/or transported involuntarily

4.1.2 Whenever the refusal of care and/or transport poses a threat to the patient’s well-being

4.1.3 Additional examples of situations where Base Physician contact should be made include, but are not limited to:
► Markedly abnormal vital sign
► Uncontrolled hemorrhage
► Suspected ischemic chest pain
► Suspected new onset Acute Stroke
► Any patient meeting critical trauma criteria
► Any condition for which field personnel believe that admission to an emergency department/hospital may be necessary
► Any time medical treatment is begun and then the patient refuses transport
CONSENT AND REFUSAL GUIDELINES

5. REQUIRED DOCUMENTATION FOR THE PATIENT REFUSING CARE:

► Physical exam
► Evidence that the patient was alert, oriented and appropriate for their age
► Indications that there were no signs of significant impairment due to drugs, alcohol, organic causes, or mental illness
► Anything else that made you believe that the patient was mentally capable
► The fact that you offered treatment and transportation
► What you told the patient about the nature of the illness/injury and the specific risks of refusal for the medical condition. (Use “quotes” as appropriate)
► The indications that the patient understood these risks
► What the patient specifically said about why he/she is refusing treatment/transport. (Use “quotes” as appropriate)
► Your efforts to encourage the patient to seek care
► The person(s), if any, who remained to look after the patient (the patient’s “support system”)
► The name of the interpreter, if applicable

6. OTHER THINGS TO CONSIDER:

6.1 Other situations where a minor may consent to but may not refuse medical care include:

► A minor who is 12 years of age or older, for the treatment of drug or alcohol problems, or infectious, contagious or communicable diseases
► A minor of any age who is pregnant, for medical care related to the pregnancy
► At least 15 years old, living separate and apart from the parent/guardian and managing his or her own financial affairs

6.2 If the parent/guardian is unavailable consent/refusal of care may be obtained over the telephone. Document exactly as you would if the parent/guardian was present on scene. Verify the name and relationship of the individual to the patient. Attempt to have another person validate the consent/refusal with the parent/guardian. Document exactly what was said, use “quotes” as appropriate

6.3 If the patient is 18 or older but there is reason to suspect that the patient has been judged incompetent by a court and placed under a legal conservatorship, seek consent from the designated guardian

6.4 If the parent/guardian is unavailable and treatment can be safely delayed:

► Document thoroughly
► Attempt to reach the parent/guardian by phone. Do not release the child in the custody of a relative or friend unless that individual has been authorized by the parent/guardian to make medical decisions for that child
► Transport to a hospital or leave in the custody of a law enforcement officer.

6.5 If the parent/guardian is unavailable and treatment cannot be safely delayed:

► Treat and transport as necessary to prevent death or serious disability (implied consent)
► Document on the PCR to show that your treatment was reasonable and necessary under the circumstances

6.6 If the parent/guardian is available but refuses to consent for necessary, emergency treatment:

► Explain the risks of refusal
► Be persuasive and/or get help from family members, Base Physician or law enforcement
► Document the situation/statements by parent/guardian thoroughly on the PCR and complete an Alameda County EMS Refusal of Care form
CONSENT AND REFUSAL GUIDELINES

6.7 An individual under arrest or incarcerated is legally capable of consenting or refusing medical care.

6.8 The law presumes that an individual is competent to consent or refuse. The party alleging a lack of capacity has the legal burden of proving it. Document accordingly; anyone forcing treatment on an unwilling patient must be able to prove both the necessity of the treatment and the incapacity of the patient.

6.9 If you cannot complete the refusal of service log due to scene safety issues or upon the insistence of another agency, complete an unusual occurrence form and send it to the EMS Agency.

7. REFUSAL OF SERVICE - applies to those persons who do not meet (see 2.1) the definition of a patient and are refusing all EMS services. The offer of an assessment and transport must be made and refused by the individual. **BLS and ALS personnel may honor a refusal of service.**

7.1 The individual must meet all of the following criteria:

► Does **not** have a complaint suggestive of potential illness or injury
► Does **not** request evaluation for potential illness or injury
► Does **not** have obvious evidence of illness or injury
► Has **not** experienced an acute event that could reasonably lead to illness or injury
► Is **not** in a circumstance or situation that could reasonably lead to illness or injury

7.2 Actions:

► Honor the refusal
► Enter the individual’s name on the “Refusal of Service log” and obtain a signature
► Complete a PCR detailing circumstances of refusal of service
► In an event where multiple people sign a Refusal of Service log, complete one PCR detailing the circumstances of that event (**not one for each patient**)
CONSENT AND REFUSAL GUIDELINES

DISPOSITION OF MINORS (see section 6)
- Minors must be left in the custody of a parent, guardian, conservator or law enforcement
- Consent to leave a minor on-scene can be obtained from a parent, guardian or conservator via telephone
  » Make base contact it appropriate
  » Document the conversation on the appropriate ROC or ROS form
  » Thoroughly document the conversation and circumstances of the encounter on the PCR. Pay special attention to include minimum documentation requirements in section 5 above

MENTAL CAPACITY
- Understands:
  » Nature of the medical condition
  » Risks and consequences of refusing care
- Exhibits no evidence of:
  » ALOC
  » Alcohol or drug ingestion that impairs judgment
- Oriented to Person, Place, Time, and Event

LEGAL CAPACITY
- 18 or over
- Emancipated minor:
  » Declaration of emancipation
  » Married
  » On active military duty

CONSIDER BASE CONTACT FOR PATIENTS WHO REFUSE TRANSPORT (see section 4 above)

CONSENT AND REFUSAL GUIDELINES

Does the person have legal capacity to refuse care?
YES

Does the person have mental capacity to refuse care?
YES

Is the person defined as a patient? (see 2.1 above)
YES

Go to Section 3
REFUSAL OF CARE
Note: ALS Personnel only

NO

Does the person have mental capacity to refuse care?
YES

Is a parent, guardian, conservator, or PD available?
YES

Go to Section 7
REFUSAL OF SERVICE
Note: BLS and ALS personnel may honor a Refusal of Service

NO

Transport

NO

Does the person have legal capacity to refuse care?
NO

NOTE TO BLS PERSONNEL: If the individual is defined as a patient and is refusing care, the patient requires an assessment by an ALS provider. Treat as necessary while awaiting the arrival of ALS personnel.
CONTINUOUS POSITIVE AIRWAY PRESSURE – CPAP

1. **PURPOSE:** To improve ventilation and oxygenation, and avoid intubation. **CPAP is required for all ALS providers.**

2. **INDICATIONS:** Patients age 8 or older in severe respiratory distress and:
   - CHF with pulmonary edema
   - Near-drowning
   - Other causes of severe respiratory distress

3. **CONTRAINDICATIONS** - Bag-valve-mask ventilation or endotracheal intubation should be considered for any patient who exhibits one or more of the following contraindications

   3.1 **Absolute Contraindications** (DO NOT USE):
   - Age < 8
   - Respiratory or cardiac arrest
   - Agonal respirations
   - Severely depressed level of consciousness
   - Systolic blood pressure < 90
   - Signs and symptoms of pneumothorax
   - Inability to maintain airway patency
   - Major trauma, especially head injury with increased ICP or significant chest trauma
   - Facial anomalies or trauma (e.g., burns, fractures)
   - Vomiting

   3.2 **Relative Contraindications** (USE CAUTIOUSLY):
   - History of Pulmonary Fibrosis
   - Decreased LOC
   - Claustrophobia or unable to tolerate mask (after first 1-2 minutes trial)

4. **COMPLICATIONS:**
   - Hypotension
   - Pneumothorax
   - Corneal Drying

5. **GOALS OF CPAP:**
   - Elimination of dyspnea
   - Decreased respiratory rate
   - Decreased heart rate
   - Increased \( \text{SpO}_2 \)
   - Stabilized blood pressure

*Bag-valve-mask ventilation or endotracheal intubation should be considered if the patient fails to show improvement based on the above goals.*
CONTINUOUS POSITIVE AIRWAY PRESSURE – CPAP

For all CPAP patients:

6. **FAILURE TO IMPROVE:** Should the patient fail to show improvement with CPAP (as evidenced by the following) remove the CPAP device and assist ventilations with BVM, as needed

   6.1 Sustained or increased heart rate,
   6.2 Sustained or increased respiratory rate,
   6.3 Sustained or increased blood pressure,
   6.4 Sustained or decreasing pulse oximetry readings, and/or
   6.5 Decrease in level of consciousness

7. **DOCUMENTATION:**

   7.1 The use of CPAP must be documented on the PCR
   7.2 Vital signs (BP, HR, RR, SpO₂) must be documented every 5 minutes.
   7.3 Narrative documentation should include a description of the patient's response to CPAP. Refer to "Goals of CPAP" for descriptive terms that may be useful
   7.4 Additional narrative documentation should include if the patient does not respond to CPAP and endotracheal intubation is required
1. **INTRODUCTION:** 12-lead electrocardiograms (EKGs) are used with a variety of patients and should be used with a number of patient care policies (e.g., ALOC (page 35), Chest Pain/MI (page 39), and CHF/Pulmonary Edema (page 45). Treatment under these policies should proceed in conjunction with the application of the 12-lead EKG. Our goal is to incorporate the 12-lead EKG into our destination decision making process with regard to the ST-elevation MI (STEMI) patient. The transmission or reporting of the ST-elevation MI should decrease “door-to-intervention” times in our communities’ hospitals. Only ALS personnel who are employed by an agency with an approved 12-lead EKG program and who have received the required training may perform a 12-lead EKG. [see 12-LEAD EKG PROGRAM (#4210) in the Administrative Manual for training and program requirements]. 12-lead EKG is required for ALS transport providers.

2. **INDICATIONS:** Any patient with known or suspected Acute Coronary Syndrome (ACS)

   - chest pain
   - dyspnea
   - discomfort or tightness radiating to the jaw, shoulders or arms
   - anxiety
   - nausea
   - syncope/dizziness
   - ROSC
   - other “suspicious symptoms”
   - diaphoresis
   - known treatment for ACS

3. **EKG CRITERIA FOR STEMI:** convex, “tombstone,” or flat ST segment elevation in two or more contiguous leads. Use the machine reading “acute MI” or the equivalent, as the principal determinant for STEMI assessment.

<td>(510) 608-1367</td>
</tr>
</tbody>
</table>
4. **PROCEDURE:**

4.1 Attach EKG leads to the patient (limb leads to the upper arms and ankles, and six chest leads). Perform an EKG as indicated in #3 above

- V1: right 4th intercostal space
- V2: left 4th intercostal space
- V3: halfway between V2 and V4
- V4: left 5th intercostal space, mid-clavicular line
- V5: horizontal to V4, anterior axillary line
- V6: horizontal to V5, mid-axillary line
- V4R: right 5th intercostal space, mid-clavicular line (use in all suspected inferior MIs)

4.2 If the EKG machine is reading “Acute MI” or the equivalent, or definite new left bundle branch block, **immediately transmit the EKG and notify the STEMI Receiving Center.** Use the machine reading as the principal determinant for STEMI assessment. Use your clinical judgment for situations outside of those listed above

4.3 Include the following information in your report:

- Age and sex
- Interpretation of the 12-lead EKG (leads, amount of ST elevation in millimeters, “confidence” in your 12-lead assessment)
- Location of reciprocal changes (if applicable)
- Symptoms (including presence or absence of chest pain)
- Presence of new left bundle branch block. Presence of imposters (early repolarization left bundle branch block, left ventricular hypertrophy, pericarditis or paced rhythms).
- Significant vital signs and physical findings
- Time of onset
- Estimated time of arrival to receiving STEMI Receiving Center

4.4 Transport patients with ST elevation in two or more contiguous leads and symptoms of ACS to the closest, most appropriate STEMI Receiving Center. Personnel should consider traffic and weather conditions, as well as the patient’s choice of facility or physician

4.5 Attach a copy of the EKG to the hospital copy and the file copy of the PCR

4.6 Serial 12-lead EKGs, en route, are required in patients with strong symptomology and are encouraged in all other patients

4.7 Follow your agency’s procedure for QI purposes
HEMORRHAGE CONTROL

1. INTRODUCTION: Controlling severe bleeding from an extremity injury can be challenging (especially in the lower limbs). Use of a County approved tourniquet can assist in the care of patients with uncontrollable bleeding in the extremities safely and effectively when the appropriate precautions are taken. Approved for both ALS and BLS.

2. INDICATIONS:
   - Amputation
   - Failure to stop bleeding with pressure dressing(s)
   - Injury does not allow control of bleeding with pressure dressing(s)
   - Impaled foreign body with ongoing extremity bleeding
   - Under difficult or dangerous situation for responding caregivers
   - Mass casualty event
   - Significant extremity hemorrhage in the face of any or all of:
     - Need for airway management
     - Need for breathing support
     - Circulatory shock
     - Need for other emergent interventions or assessment
     - Significant bleeding from multiple locations

3. Tourniquet: Place county approved tourniquet according to manufacturer’s instructions.

4. HEMOSTATIC AGENT: After tourniquet placement, and to aid in severe arterial bleeding; or to control severe bleeding where tourniquets are not indicated (trunk, head, neck, etc), use of a hemostatic agent is indicated. The only hemostatic agent approved for use in Alameda County is the QuikClot Combat Gauze. Use of combat gauze is optional. Additional training is required for use of Combat Gauze. If your agency decides to implement the use of QuikClot Combat Gauze, it’s use is limited to ALS personnel only.

5. INDICATIONS:
   - Bleeding that is not controllable with the use of a tourniquet or other means.

6. PROCEDURE: QuikClot Combat Gauze is approved for use in Alameda County.

DIRECTIONS FOR USE

1. Open package and remove Combat Gauze. Keep the empty package.

2. Pack Combat Gauze into wound and use it to apply pressure directly over bleeding source. (More than one Combat Gauze may be required).

3. Continue to apply pressure for 3 minutes or until bleeding stops.

4. Wrap and tie bandage to maintain pressure. Seek medical care immediately. Show PRODUCT REMOVAL directions on package to medical personnel.

PRODUCT REMOVAL: 1. Gently remove gauze from wound. 2. Thoroughly irrigate wound.
HEMORRHAGE CONTROL

Tourniquet Reassessment Algorithm

Significant Extremity Bleeding with need for other interventions?*

运输时间>30分钟？

Go to tourniquet reassessment algorithm

Transport time < 30 minutes expected?

Go to tourniquet removal algorithm

* Before applying a tourniquet, and if time permits, attempt to control bleeding via direct pressure

Tourniquet Removal Algorithm§

Amputated extremity?

Significant Extremity Bleeding with need for other interventions?*

Appendix: Do not go to the Tourniquet Removal Algorithm unless transport time is greater than 30 minutes AND criteria have been met in the Tourniquet Reassessment Algorithm for removal

Apply pressure dressing before loosening tourniquet.

After applying pressure dressing, loosen tourniquet (leave it in place)

Retighten tourniquet and transport

Significant Bleeding from site?

Reassess as needed

Before applying a tourniquet, and if time permits, attempt to control bleeding via direct pressure

Procedures

HEMORRHAGE CONTROL

Modified On: May 6, 2013

131
1. **INTRODUCTION:** ResQPOD® is an impedance threshold device (ITD) that enhances the vacuum in the chest that forms during the chest recoil phase of CPR. Studies have shown that this process draws more blood back to the heart (increases preload), and increases cardiac output, blood pressure, perfusion to vital organs and survival rates.

2. **WARNINGS:** Contraindicated in patients where cardiopulmonary resuscitation (CPR) is not indicated. Never use on patients with pulse or spontaneous breathing. Remove immediately from ventilation circuit once CPR is discontinued.

3. **INDICATIONS:** To be used on all patients ≥ 8 years of age in cardiac arrest.

4. **CONTRAINDICATIONS:**
   - 4.1 Patients under the age of eight (8)
   - 4.2 Patients with a flail chest.

5. **PROCEDURE:** The ResQPOD can be used for either basic or advanced life support during cardiac arrest, with a bag-valve mask attached to a face mask, an endotracheal (ET) tube, or other airway devices (e.g. - King-LTD).
   - 5.1 Select airway adjunct (tube or mask)
   - 5.2 Attach bag-valve to air intake port on ResQPOD
   - 5.3 Slide the Ventilation Timing Assist Light switch to on when using the ResQPOD in an intubated patient
   - 5.4 Begin CPR (**page 9**):
     - Allow for complete chest release/recoil after each compression
     - Follow recommended ventilation rates
     - **DO NOT** hyperventilate
   - 5.5 Use 30:2 compressions:ventilation ratio (15:2 for infants and children with 2 rescuers) for basic life support when using a facemask. Ventilate intubated patients 8-10 breaths/minute with each breath lasting 1.5 seconds (maximum) to optimize CPR and ResQPOD efficacy. Excessive ventilation rates will reduce the effectiveness of the ResQPOD.
   - 5.6 Clean or suction vomit or secretions from the ResQPOD by removing from airway adjunct and shaking or blowing out debris using ventilation source.

**NOTE:** Discontinue use if correct function cannot be assured. After pulse and/or spontaneous respirations have been restored, immediately remove ResQPOD from ventilation circuit and help patient breathe as needed.
INTRANASAL (IN) MEDICATION ADMINISTRATION

1. INDICATIONS:
   ► Fentanyl for pain management
   ► Naloxone for suspected opiate overdose
     on patients who are apneic or near-apneic with a pulse
   -or-
   ► Midazolam for seizures or sedation

2. PROCEDURE:
   2.1 Assess ABC’s (Airway, Breathing, Circulation)
   2.2 For pulseless patient, go to appropriate cardiac arrest protocol
   2.3 Establish airway and begin bag-valve-mask ventilation with 100% O₂ if appropriate
   2.4 Load syringe with the appropriate dose. See specific treatment algorithms:
      ► Pain Management – Adult page 43 | Pediatric page 68
      ► Respiratory Depression or Apnea – Adult page 46 | Pediatric page 74
      ► Sedation – page 138
      ► Seizure – Adult page 51 | Pediatric page 78
   2.5 Attach MAD nasal atomizer
   2.6 Place atomizer 1.5 cm into the nostril
   2.7 Briskly compress the syringe to administer 1/2 of the medication
   2.8 Remove and repeat into the other nostril until all the medication has been administered.
      ► Continue ventilating the patient as needed
      ► If no appropriate response within 3 minutes, go to appropriate policy
INTRAOSSEOUS INFUSION PROCEDURE – ADULT

1. **PURPOSE:** To obtain rapid circulatory access to provide necessary intravenous fluids or medications

2. **INDICATIONS:**
   - **Approved for use in the adult patient only >8 years old and >40 kg.** (If less than 40 kg, "INTRAOSSEOUS INFUSION PROCEDURE - PEDIATRIC" on page 135)
   - Consider for use in any unconscious or seriously ill or injured patient in whom IV access cannot be established in a very timely fashion
   - Any medications or fluids that can be given in a peripheral vein can be given intraosseous.

3. **CONTRAINDICATIONS:**
   - Inability to locate tibial landmarks
   - Fracture or recent surgery in the tibia to be used
   - Infection over the insertion site

4. **POSSIBLE COMPLICATIONS:**
   - Compartment syndrome
   - Growth plate injury
   - Skin infection
   - Failed infusion
   - Bone infection
   - Bony fracture

5. **PREPARATION:**
   - Place the patient in the supine position
   - Put a small towel roll under the knee
   - Consider Pain Management page 43

6. **PROCEDURE:**
   6.1 Locate the anatomical site (one centimeter inferior and medial to the anterior tibial tuberosity) – STEP 1
   6.2 Prepare the skin with chlorhexidine. STEP 2
   6.3 Consider Pain Management page 43
   6.4 Load the appropriate needle onto the driver
   6.5 Firmly stabilize the leg near (not under) the insertion site
   6.6 Firmly press the needle against the site at a 90° angle and operate the driver. Use firm, gentle pressure. STEP 3
   6.7 As the needle reaches the bone, stop and be sure that the 5mm marking on the needle is visible; if it is, continue to operate the driver
   6.8 When a sudden decrease in resistance is felt and the flange of the needle rests against the skin, remove the driver and the stylet from the catheter. STEP 4
   6.9 Do not attempt to aspirate bone marrow (may clog needle & tubing)
   6.10 **Use a syringe to rapidly infuse 10 mL NS. (Note: this is an important step)**
      - If the patient is responsive to pain the clinician may consider use of 40mg (2 mL) 2% lidocaine slowly (1 mL over 30 seconds) for anesthetic effect prior to the 10ml normal saline flush
      - May repeat ⅓ dose (20mg or 1 mL) of 2% lidocaine once q 15 minutes for continued patient discomfort
   6.11 If no infiltration is seen, attach the IV line and infuse fluids and/or medications as normal STEP 5
   6.12 IV bag will need to be under pressure. STEP 6
   6.13 Secure the needle
1. **PURPOSE:** To obtain rapid circulatory access to provide necessary intravenous fluids or medications

2. **INDICATIONS:**
   - Approved for use in the pediatric patient >3 kg and <40 kg. (If greater than 40 kg, "INTRAOSSEOUS INFUSION PROCEDURE - ADULT" on page 134)
   - Consider for use in any unconscious or seriously ill or injured patient in whom IV access cannot be established in a very timely fashion
   - Any medications or fluids that can be given in a peripheral vein can be given intraosseous.

3. **CONTRAINDICATIONS:**
   - Inability to locate tibial landmarks
   - Fracture or recent surgery in the tibia to be used
   - Infection over the insertion site

4. **POSSIBLE COMPLICATIONS:**
   - Compartment syndrome
   - Failed infusion
   - Growth plate injury
   - Bone infection
   - Skin infection
   - Bony fracture

5. **PREPARATION:**
   - Place the patient in the supine position
   - Put a small towel roll under the knee
   - Consider Pain Management page 68

6. **PROCEDURE:**
   6.1 Locate the anatomical site (one centimeter inferior and medial to the anterior tibial tuberosity) – STEP 1
   6.2 Prepare the skin with chlorhexidine. STEP 2
   6.3 Consider Pain Management page 68
   6.4 Load the appropriate needle onto the driver
   6.5 Firmly stabilize the leg near (not under) the insertion site
   6.6 Firmly press the needle against the site at a 90° angle and operate the driver. Use firm, gentle pressure. STEP 3
   6.7 As the needle reaches the bone, stop and be sure that the 5mm marking on the needle is visible; if it is, continue to operate the driver
   6.8 When a sudden decrease in resistance is felt STOP, remove the driver and the stylet from the catheter. STEP 4
   6.9 Do not attempt to aspirate bone marrow (may clog needle & tubing)
   6.10 Use a syringe to rapidly infuse 5 mL NS. (Note: this is an important step)
      - If the patient is responsive to pain the clinician may consider use of 0.5mg/kg (max dose 20 mg) 2% lidocaine slowly (1 ml over 30 seconds) for anesthetic effect prior to the 10ml normal saline flush
      - May repeat ½ dose (0.25mg/kg) of 2% lidocaine once q 15 minutes for continued patient discomfort
   6.11 If no infiltration is seen, attach the IV line and infuse fluids and/or medications as normal STEP 5
   6.12 IV bag will need to be under pressure. STEP 6
   6.13 Secure the needle
PLEURAL DECOMPRESSION

1. **INDICATIONS:** When clinical findings reveal a tension pneumothorax (severe respiratory distress, diminished breath sounds on the affected side, tracheal deviation) with rapidly deteriorating vital signs

2. **EQUIPMENT:**
   2.1 Pleural decompression kit
   2.2 Chlorhexadine swab
   2.3 3\(^{1}/_4\) inch, 14 gauge angiocatheter
   2.4 One-way valve

3. **PROCEDURE:**
   3.1 Approved Sites:
      - 2nd or 3rd intercostal space, mid-clavicular line
      - 4th or 5th intercostal space, mid-axillary line
   3.2 Prep site with chlorhexadine
   3.3 Firmly but carefully insert the needle at a 90 degree angle just over the superior aspect (superior border) of the rib, through the skin and pleura until air escapes or a distinct "give" is felt. The undersurface of the rib should be avoided to limit injury to the neurovascular bundle. Air should be freely aspirated (if not, you are not in the pleural space)
   3.4 Remove the needle
   3.5 Attach a one-way valve. Secure with tape
   3.6 Recheck breath sounds and continuously monitor cardio-respiratory status.

4. **COMPLICATIONS:**
   4.1 Lung laceration
   4.2 Pneumothorax
   4.3 Hemorrhage secondary to damage to the intercostal artery or vein
1. **INTRODUCTION:** Patient reports to a Base Hospital, Trauma Center or Receiving Hospital should be brief and to the point. Only pertinent information should be presented initially, however the Base Physician may need to request additional information in order to make sound treatment or triage decisions. Occasionally pause briefly to confirm reception and allow for questions or orders.

2. **MEDICAL PATIENTS:**
   
   2.1 **Receiving Hospital Report**
      
      ► ETA
      
      ► General patient information - For emergent patients, include medical record number (if available without compromising patient safety and care)
      
      ► Physical assessment
         
         ✔ Vital signs / Glasgow Coma Scale
         ✔ Pertinent positives and pertinent negatives, as needed
         
         ✔ For STEMI patients see "EKG 12-Lead" policy (page 129, section 4.3) for reporting information
      
      ► Interventions made and patient response, if applicable
      
      ► Problems encountered, if applicable (e.g. unable to intubate)
   
   2.2 **Base Contact**
      
      ► General patient information
      
      ► Chief complaint and general assessment
      
      ► Patient destination and ETA
      
      ► Physical assessment
         
         ✔ Vital signs / Glasgow Coma Scale
         ✔ Pertinent positives and pertinent negatives to support the general assessment.
      
      ► Treatment rendered prior to contact and patient response, if applicable
      
      ► Specific requests for medications/procedures
   
3. **TRAUMA PATIENTS:**
   
   3.1 **Receiving Hospital Report**
      
      ► ETA
      
      ► General patient information
      
      ► Triage criteria met, including mechanism of injury
      
      ► Physical assessment
         
         ✔ Vital signs/Glascow Coma Scale
         ✔ Pertinent positives and pertinent negatives, as needed
      
      ► Interventions made and patient response, if applicable
      
      ► Problems encountered, if applicable (e.g. unable to intubate)
   
   3.2 **Trauma Destination (60 seconds)**
      
      ► ETA to the closest appropriate ED vs. TC
      
      ► General patient information
      
      ► Triage criteria met
      
      ► Mechanism of injury
      
      ► Physical assessment
         
         ✔ Vital signs, if available / Glasgow Coma Scale
         ✔ Pertinent positives and pertinent negatives
SEDATION

1. **GENERAL INDICATIONS:**
   1.1 To reduce combative behavior that endangers patient or caregivers
   1.2 As an adjunct to pain relief for ALS procedures such as cardioversion and/or cardiac pacing
   1.3 **Use CAUTION with:**
      - Concomitant use of an opiate and midazolam can cause significant respiratory depression, hypotension and decreased level of consciousness. Administer concomitantly only when absolutely indicated. Administer lower doses of one or both agents
      - Elderly patients are especially sensitive to the effects of midazolam. They should receive a lower dose and especially close monitoring
      - A very small proportion of patients may have a paradoxical effect (i.e. - increased agitation)

2. **CONTRAINDICATIONS:**
   2.1 **Absolute:**
      - Sensitivity to midazolam
      - Systolic BP < 90 mmHg (adult) - except for patients who need TCP or cardioversion
   2.2 **Relative:**
      - Nausea/vomiting
      - Suspected drug/alcohol intoxication
      - Head injury
      - Concomitant narcotic administration - (this is a RELATIVE contraindication and is not intended to prevent the use of necessary narcotic analgesia, when indicated)

   *(These MAY be the most likely cause for the condition that requires proposed sedation. The best judgment of the paramedic is necessary to evaluate the need for sedation)*

3. **PROCEDURE:**
   3.1 Give supplemental oxygen (titrate to 94-99% \( \text{SpO}_2 \))
   3.2 Institute continuous cardiac monitoring
   3.3 Continuously monitor the patient using the Airway Checklist, including ETCO\(_2\)
   3.4 Establish IV access if possible
   3.5 Be prepared to provide airway/ventilation management
   3.6 Ensure that receiving hospital personnel are aware that patient has been sedated

### MEDICATION – DOSE/ROUTE:

#### MIDAZOLAM: (see weight-based chart)

**Adult:**
- **IV/IO (slowly) / IN (briskly):** 1-2 mg - loading dose. Titrate to desired degree of sedation. May repeat x 2, q 5 minutes, to a total maximum dose of 6 mg
- **IM:** 2-4 mg - if unable to establish IV access. May repeat x 1, q 30 minutes

**Pediatric:** (> 5kg or <40kg)
- **IV (slowly) / IN (briskly):** 0.05 mg/kg - loading dose. Titrate to desired degree of sedation. May repeat x 2, q 5 minutes, to total maximum dose of 3 mg
- **IM:** 0.1 mg/kg - if unable to establish IV access. May repeat x 1, q 30 minutes

1. INTRODUCTION:

1.1 Omit SMR if all assessment criteria are safely assessed and normal

1.2 Consider SMR for a patient who is suspected of having a traumatic unstable spinal column injury. Have high index of suspicion for pediatrics and patients with degenerative skeletal/connective tissue disorders (i.e. osteoporosis, elderly, previous spinal fractures, etc)

1.3 Victims of penetrating trauma (stabbings, gunshot wounds) to the head, neck, and/or torso SHOULD NOT receive SMR unless there is one or more of the following:
   - Obvious neurologic deficit to the extremities
   - Significant secondary blunt mechanism of injury (e.g.- fell down stairs after getting shot)
   - Priapism
   - Neurogenic shock
   - Anatomic deformity to the spine secondary to injury

2. Pediatric Patients and Car Seats:

2.1 Infants restrained in a rear-facing car seat may be immobilized and extricated in the car seat. The child may remain in the car seat if the immobilization is secure and his/her condition allows (no signs of respiratory distress or shock)

2.2 Children restrained in a car seat (with a high back) may be immobilized and extricated in the car seat; however, once removed from the vehicle, the child should be placed in SMR

2.3 Children restrained in a booster seat (without a back) need to be extricated and immobilized following standard SMR procedures

3. Helmet removal: Safe and proper removal of the helmet should be done by two people following steps outlined in an approved trauma curriculum
SPINAL INJURY ASSESSMENT

POTENTIAL FOR UNSTABLE SPINAL INJURY?

YES

RELIABLE PATIENT?

YES

NORMAL SPINE EXAM?

YES

NORMAL MOTOR/SENSORY?

YES

OMIT SMR

NO

POSSIBLE SPINE INJURY

APPLY SMR

High-Risk Factors:
- Age ≥ 65
- Meets Trauma Patient Criteria for Mechanism of Injury (Section 3)
- Axial load to the head (e.g. - diving injury)
- Numbness or tingling in extremities

If any one of the high-risk factors above are present, strongly consider SMR

A Reliable Patient is cooperative, sober and alert without:
- Significant Distracting Injuries
- Language Barrier

SPINAL PAIN/TENDERNESS
- Palpate vertebral column thoroughly

Low-Risk Factors:
- Simple rear-end MVC
- Ambulatory at any time on scene
- No neck pain at scene
- Absence of midline cervical spine tenderness

The low-risk factors above allow safe omission of SMR

MOTOR/SENSORY EXAM:
- Wrist or finger extension (both hands)
- Plantarflexion (both feet)
- Dorsiflexion (both feet)
- Check gross sensation in all extremities
- Check for abnormal sensations to extremities (e.g. parathesias)

State of Maine Criteria
SPINAL MOTION RESTRICTION (SMR)

1. INTRODUCTION: The term spinal motion restriction (SMR) better describes the procedure used to care for patients with possible unstable spinal injuries. SMR includes:
   - Reduction of gross movement by patient
   - Prevention of duplicating the damaging mechanism to spine
   - Regular reassessment of motor/sensory function

2. PURPOSE: To decrease the risk of negative effects caused by traditional spinal immobilization while still providing appropriate care to patients with possible spinal injury by implementing alternative methods to achieve SMR.

3. INDICATIONS: Any patient identified by Alameda County's Spinal Injury Assessment to warrant spinal motion restriction. The spinal injury assessment should be performed prior to application of SMR.

4. PROCEDURE: If patient experiences negative effects of SMR methods used, alternative measures should be implemented.
   - Methods/tools to achieve SMR that are allowable: (less invasive to more invasive) lateral, semi-fowler’s or fowler’s position with cervical collar only, soft collars, pillows, vacuum splint or mattress, children's car seats, KED, backboards with adequate padding, head immobilizers and straps.
   - Provide manual stabilization restricting gross motion. Alert and cooperative patients may be allowed to self-limit motion if appropriate with or without cervical collar.
   - Apply cervical collar.
   - If needed, extricate patient limiting flexion, extension, rotation and distraction of spine.
   - Considerations for patient movement when decision to SMR has been made:
     - Keeping with the goals of restricting gross movement of spine and preventing increased pain and discomfort, self-extrication by patient is allowable.
     - Pull sheets, other flexible devices, scoops and scoop-like devices can be employed if necessary. Hard backboards should only have limited utilization.
   - Apply adequate padding or vacuum mattress to prevent tissue ischemia and increase comfort.
   - Place patient in position best suited to protect airway.
   - Regularly reassess motor/sensory function (include finger abduction, wrist/finger extension, plantar/dorsal flexion and sharp/dull exam if possible).
   - Consider the use of SpO₂ and EtCO₂ to monitor respiratory function.

5. SPECIAL CONSIDERATIONS
   - Patients with acute or chronic difficulty breathing: SMR has been found to limit respiratory function an average of 17% with the greatest effect experienced by geriatric and pediatric subjects restricted to a hard backboard.
     - Use SMR with caution with patients presenting with dyspnea and position appropriately.
   - Pediatric patients:
     - Consider use of padded pediatric motion restricting board.
     - Avoid methods that provoke increased spinal movement.
     - If choosing to apply SMR to patient in car seat, ensure that proper assessment of patient posterior is performed.
   - Combative patients: Avoid methods that provoke increased spinal movement and/or combativeness.
1. **INTRODUCTION:**

1.1 Temporary or permanent placement of a tracheostomy tube is often necessary to maintain an open airway. Patients with tracheostomy tubes or stomas should not be intubated orally. Suctioning of surgical airways is often required to attempt to clear and maintain an open airway. Administration of inhaled medications will need to be given via the stomas or tracheostomy tubes.

1.2 **Tracheostomy tube replacement:** A dislodged tracheostomy tube should not be replaced unless the paramedic has the skill and training to do so. Training should be consistent with the material contained in “Pediatric Education for Prehospital Personnel – 2000” pages 300-302. (See #4 below for stoma intubation technique.)

2. **SUCTIONING:**

2.1 **Equipment:**

2.1.1 Appropriate sized suction catheter (Pediatrics use 8-10F)

2.1.2 Suction unit with adjustable suction capacity

2.1.3 Bag-valve-mask with oxygen supply

2.1.4 5 mL syringe filled with sterile saline

2.2 **Contraindication:** Use of demand valve

2.3 **Procedure:**

2.3.1 Adjust suction to 120 - 150 mmHg for adults; decrease suction to 80 - 100 mmHg for pediatrics

2.3.2 Apply sterile gloves

2.3.3 Flush suction catheter with saline to lubricate tip and establish patency of suction catheter

2.3.4 Remove the T tube if a tracheostomy patient is on humidified oxygen

2.3.5 Ventilate the patient with 100% oxygen several times

2.3.6 Insert the suction catheter into the stoma or tracheostomy opening with the suction off (the thumb hole open). The short length of the tracheostomy tube facilitates suctioning. The catheter may be directed through the right or left bronchus by having the patient turn his/her head to the opposite side

2.3.7 Apply suction by occluding the thumb hole while slowly withdrawing the catheter in a twisting motion. Suction of a tracheostomy tube should take no longer than 10 seconds for the adult patient and 3-4 seconds for the pediatric patient

2.3.8 If mucus plugs or thick secretions are present, the instillation of 3 - 5 mL of sterile saline may be helpful

2.3.9 Pre-oxygenate with 100% O₂

2.3.10 Check breath sounds

2.3.11 Suctioning can stimulate a cough reflex. Allow the patient to cough. Be prepared to suction or catch secretions from the tracheal opening. Recheck breath sounds

3. **ALBUTEROL MEDICATION ADMINISTRATION:**

3.1 **Equipment**

3.1.1 Albuterol

3.1.2 Sterile Normal Saline
3.1.3 Hand Held Nebulizer
3.1.4 Oxygen tubing and supply
3.1.5 Additional reservoir tubing (optional)

3.2 Procedure:
3.2.1 Assure clear airway. Suction if necessary
3.2.2 Assemble hand held nebulizer as for patient with intact upper respiratory track
3.2.3 Attach trach collar to reservoir tubing
3.2.4 Connect oxygen delivery tubing to oxygen source at sufficient flow rate to produce misting
3.2.5 Fit trach collar over stoma or tracheostomy tube
3.2.6 Instruct patient to breathe slowly and deeply
3.2.7 Optional: Mouthpiece may be replaced by additional reservoir tubing.

4. STOMA INTUBATION:
4.1 Equipment:
4.1.1 appropriate sized cuffed and uncuffed ET tubes
4.1.2 bag-valve-mask
4.1.3 appropriate sized suction catheters
4.1.4 oxygen supply
4.1.5 suction equipment with adjustable suction capacity

4.2 Contraindication: Use of demand valve

4.3 Procedure:
4.3.1 Select the largest endotracheal tube that will fit through the stoma without force. Check the cuff, unless an uncuffed tube is being used on a pediatric patient
4.3.2 Pre-oxygenate with 100% oxygen using a bag valve mask device with the face mask fitted over the stoma. Do not use demand valve
4.3.3 Wear sterile gloves. Do not use a stylet. It is not necessary to lubricate the tube
4.3.4 Suction, if necessary
4.3.5 Pass the endotracheal tube and inflate the cuff. The pharynx has been bypassed, so the tube will protrude from the neck several inches
4.3.6 Hold the tube in place, watch for chest rise with ventilation
4.3.7 Secure the tube and ventilate with 100% O₂
4.3.8 Auscultate the lung fields. Check the neck for subcutaneous emphysema, indicating false passage
4.3.9 Allow no longer than 30 seconds for the procedure
TRANSCUTANEOUS PACING - TCP

1. INDICATIONS: This procedure should be used on patients experiencing symptomatic bradycardia (see Adult and Pediatric Bradycardia - page 38 and page 66). This includes patients with “failed” pacemakers. Note: Bradydysrhythmias in children are usually due to respiratory causes. Consider alternate causes of the dysrhythmia and treat appropriately prior to initiation of TCP:
   - Hypoxia
   - Trauma
   - Drug overdose
   - Electrolyte imbalance (not treatable in the field setting)
   - Hypothermia

2. CONTRAINDICATIONS:
   2.1 Asystole
   2.2 Bradyasystolic arrest

3. TCP should not be delayed pending IV access or while waiting for atropine to take effect in an unstable patient. TCP should be initiated simultaneously with atropine in this setting

4. PROCEDURE:
   4.1 Consider administering midazolam (see sedation procedure) and/or Pain Management (Adult page 43 - Pediatric page 68). Decrease dose of one or both agents with concomitant midazolam administration or age > 65
   4.2 If unable to start IV, consider administering IM
   4.3 Place pads on the patient
   4.4 Set initial TCP rate at 80 beats per minute (bpm)
   4.5 Begin output at 0 milliamps (mA). Increase by 10 mA until capture/pulses are noted. Once capture is confirmed, continue pacing at a slightly higher output level (10%)
   4.6 If capture is maintained but the patient remains symptomatic of inadequate tissue perfusion (BP < 90 systolic, altered level of consciousness) consider increasing the rate by 10 bpm until 100 bpm is reached
   4.7 If perfusion remains a problem, consider dopamine
   4.8 Contact the Base Physician for consultation if perfusion remains a problem and/or alteration of TCP settings
TRANSFER OF CARE

AUTHORITY: Division 2.5 of the California Health and Safety Code, Section 1798.6

"Authority for patient health care management in an emergency shall be vested in that licensed or certified health care professional, which may include any paramedic or other prehospital emergency personnel at the scene of the emergency, who is most medically qualified specific to the provision of rendering emergency medical care. If no licensed or certified health care professional is available, the authority shall be vested in the most appropriate medically qualified representative of public safety agencies who may have responded to the scene of an emergency."

"Notwithstanding ... authority for the management of the scene of an emergency shall be vested in the appropriate public safety agency having primary investigative authority. The scene of an emergency shall be managed in a manner designed to minimize the risk of death or health impairment to the patient and to other persons who may be exposed to the risks as a result of the emergency condition, and priority shall be placed upon the interests of those persons exposed to the more serious and immediate risks to life and health. Public safety officials shall consult emergency medical services personnel or other authoritative health care professionals at the scene in the determination of relevant risks."

1. Medical personnel will not enter an unsafe emergency/crime scene, or continue to render care until released by the incident commander. Public safety personnel shall secure the scene to make entry reasonably safe

2. Components of the transfer of care at the scene of an emergency include:
   2.1 Evaluation of the scene
   2.2 Medical aspects of extrication and all movement of the patient(s)
   2.3 Assessment
   2.4 Treatment rendered
   2.5 Destination

3. If a disagreement occurs between medical personnel at the scene on any aspects of the transfer of care:
   3.1 If time permits, contact the Base Physician to determine the appropriate treatment/destination. Otherwise, the more conservative patient-based decision will prevail (e.g. if field personnel disagree on transport vs. non-transport, the patient will be transported)
   3.2 If necessary, involved personnel will immediately notify the EMS on-call representative through ALCO-CMED. The EMS on-call representative will notify the EMS Medical Director
   3.3 If appropriate, the EMS Medical Director will organize a meeting with the involved personnel to resolve the issues within two (2) business days

1. INTRODUCTION

1.1 ACTIVE SHOOTER RESPONSE - The EMS response to Active Shooter Incidents needs to be coordinated with on scene law enforcement.

1.2 EMS providers need to be ready to enter a secured scene quickly and aggressively.

1.3 EMS providers should be “forward leaning” and have trauma focused medical gear and triage tools available.

1.4 Working closely with law enforcement is critical in getting life saving medical assets to the injured as soon as the threat has been mitigated or neutralized. The UNIFIED COMMAND model is best for these types of incidents.

1.5 Make sure law enforcement command knows that an EMS team is ready, staged and awaiting direction. Most SWAT teams have an imbedded tactical medic that would be the logical liaison to EMS assets on scene.

1.6 Concepts applied are based on the Tactical Combat Casualty Care (TCCC) and the International School of Tactical Medicine (ISTM).

2. Consider the following items during an EMS response to an Active Shooter Incident:

► Communication must be maintained throughout the incident with respective dispatch centers and on scene medical, fire and law enforcement.

► Law enforcement is in charge of the event. While in a warm zone environment, EMS should follow the direction of law enforcement.

► Law enforcement may provide a protective envelope (force protection model) around EMS providers and escort them into “warm zone” areas to treat or evacuate victims. (No active threat in the area)

► Make sure to have emergency egress routes and casualty collection points (CCP), as well as evacuation rally points identified.

► If EMS team is brought in to extricate patient, only minimal equipment should be carried. Roll up evacuation stretchers should be considered.

► EMS teams need to be prepared to split up if law enforcement requires it.

► EMS providers should use individual medical packs with life saving bleeding and airway tools so they can work “independently” on trauma victims.

► Spinal motion restriction is not indicated for patients suffering only from penetrating trauma.

► Once the threat is eliminated, law enforcement may be available to help evacuate the injured.

INCIDENT

ON-SCENE
Incident Commander (IC) has authority to request Chempack(s) based on medical personnel (Fire/EMS) assessment of presenting symptoms of patients and other field specific information (detectors, intelligence)

REQUEST MADE TO DISPATCH

LLNL DISPATCH
Dispatch (CAD) determines best (closest) Chempack and automatically dispatches request to housing facility. Fire/EMS Unit transports Chempack to the scene and reports to appropriate destination (i.e. staging, medical)

FIRE/EMS CHEMPACK STORAGE SITE
Fire/EMS Chempack site opens (break seals), loads up and transports unit to site location (staging, medical, etc.)

ON-SCENE MEDICAL
Medical unit utilizes Chempack assets on-scene and en-route to hospitals

HOSPITAL
Treatment continues in hospital with on-site Chempack assets
CYANIDE POISONING

- This policy is to be used in conjunction with Smoke Inhalation page 21 and HazMat page 157
- Medications are only given if the patient is showing signs and symptoms of cyanide poisoning. THEY ARE NOT TO BE GIVEN PROPHYLACTICALLY

**Symptoms:**
- Exposure to a vapor or liquid that may smell like "bitter almonds"
- Upper airway and/or eye irritation
- Flushing
- Headache

**Signs:**
- Transient hyperpnea, followed by seizures, apnea and cardiac collapse
- Tremor

**Signs and/or symptoms of cyanide exposure**
- Anxiety
- Agitation
- Vertigo
- Weakness
- Nausea
- Muscular trembling
- Normal pupils
- Diaphoresis
- Cyanosis

---

**Warm Zone**

Monitor IV NS

**Sodium Thiosulfate IV**

- Adult: 12.5 grams
- Child: 0.4 gm/kg (max dose 12.5 grams)

Intubate if apneic

**Hot Zone**

High flow O2 (if available)
DECONTAMINATION INCIDENT

This policy is for instances where a patient presents to EMS personnel without forewarning of a possible hazardous materials incident.

All patients exposed or contaminated by suspected hazardous materials should be decontaminated prior to transportation to the emergency department.

e.g. - Industrial Response Team, Fire Hazardous Materials Response

1. Paramedics will advise the base hospital of the following:
   1.1 Nature of the emergency (i.e., describe the incident)
   1.2 Total number of suspected patients exposed or contaminated
   1.3 Number of patients exposed and exhibiting symptoms
   1.4 Chemical identification, if known
   1.5 Patient status
   1.6 Treatment prior to transport
   1.7 Describe decontamination provided on scene
   1.8 ALS, BLS

2. Base will acknowledge report and advise on further treatment as necessary. If, while enroute to the hospital, the crew inadvertently discovers a potentially contaminated individual, the following instructions will be followed:
   2.1 Crew should ensure that receiving hospital has clear understanding of the potential for a hazardous materials incident
   2.2 Stage the ambulance away from the receiving hospital ED until notified where the decontamination area will be located
   2.3 Keep the patient and ambulance personnel in or near the ambulance until the decontamination area is ready to receive the patient(s)
   2.4 Ambulance personnel should remain in or near their vehicle until the decontamination team is ready to decontaminate EMS personnel, if necessary
1. **Background:**

1.1 Principal type of “dirty bomb” combines a conventional explosive such as Dynamite/Explosives with radioactive material

1.2 A conventional explosive itself would have more immediate lethality than dirty bombs

1.3 Most probably, not enough radiation would be present in a dirty bomb to:
   - Kill people
   - Cause severe illness

1.4 Most radioactive material employed in hospitals is sufficiently benign

1.5 About 100,000 patients a day are released with this material in their bodies

1.6 Certain other radioactive materials could contaminate up to several city blocks

1.7 It could create fear and possibly panic and requiring potentially costly cleanup

1.8 A second type of RDD might involve a powerful radioactive source hidden in a public place

1.9 Hiding places may include such places as:
   - Trash receptacles
   - Latrines
   - Delivery vehicles
   - Vending machines
   - Parked vehicles

1.10 A dirty bomb is in no way similar to a nuclear weapon

1.11 The presumed purpose of its use would be as a Weapon of Mass Disruption

1.12 Not as a Weapon of Mass Destruction

2. **Impact of a Dirty Bomb:**

2.1 The extent of local contamination would depend on a number of factors

2.2 Factors includes:
   - The size of the explosive
   - The amount and type of radioactive material used
   - The weather conditions

2.3 Prompt detection of the kind of radioactive material employed would greatly assist local authorities

2.4 It would assist in advising the community on protective measures, such as:
   - Quickly leaving the immediate area or
   - Going inside until being further advised

2.5 Subsequent decontamination of the affected area could involve considerable:
   - Time
   - Expense

3. **What Should You Do Following an Explosion**

3.1 Move away from the immediate area—at least several blocks from the explosion

3.2 Head inside and establish shelter-in-place

3.3 This to reduce exposure to radioactive dust
RADIOLOGICAL DISPERSION DEVICE (RDD), AKA “DIRTY BOMB”

3.4 Turn to radio/TV channels for advisories from:
  ► Emergency response
  ► Health authorities

3.5 If facilities are available, remove clothes and place them in a sealed plastic bag

3.6 Save contaminated clothing to allow for testing for radiation exposure

3.7 Take a shower to wash off dust and dirt, or to reduce radiation exposure, if the explosive device is radioactive

3.8 If radiation was released, local news will advise people where to report for:
  ► Radiation monitoring
  ► Blood tests
  ► Other tests

3.9 Test to determine if in fact exposed and what steps to take to protect health.

4. Risk of Cancer

4.1 Short time or small doses of radioactive dust does not mean a person will get cancer

4.2 The additional risk will likely be very small

4.3 Potassium Iodide (KI) will not be protective except in the unlikely event that the dirty bomb contained radioactive iodine isotopes

4.4 The iodine isotopes would have to be in large quantities

4.5 Radioactive iodine isotopes are not particularly attractive for use in an RDD

4.6 KI only protects the thyroid from radioactive iodine

4.7 KI offers no protection to other parts of the body or against other radioactive isotopes
HAZARDOUS MATERIALS INCIDENTS - EMS RESPONSE

The information contained in this policy is based on guidelines contained in EMSA #231 - Hazardous Materials Medical Management Protocol

1. **INTRODUCTION:** Individuals who respond to and function within the **Exclusion Zone** (Hot Zone) or **Contamination Reduction Zone** (Warm Zone) must be members of specially trained HazMat teams, trained in the use of self contained breathing apparatus, selection of appropriate chemical protective suits and how to function in them. Other rescuers should be trained in accordance with **Federal OSHA** standards identified in OSHA 29 CFR 1910.120 and **California OSHA** as defined in the California Code of Regulations, Title 8, Section 5192.

2. **EMS interface with HazMat teams**

   2.1 The Incident Command System (ICS) shall be used for on scene management

   2.2 The Medical Branch Supervisor shall make contact with the Incident Commander, face-to-face or by radio, who will direct the Medical Branch Supervisor to the Hazardous Materials Group Supervisor

   2.3 Pertinent information will be relayed to the Medical Branch Supervisor including, patient information (number requiring transport and injuries) and the type of exposure (chemical name and information about the chemical [SPELL CHEMICAL NAME])

   2.4 The Medical Branch Supervisor shall make Base contact in order to obtain recommendations regarding decontamination and patient treatment

   2.5 Once cleared by the Site Access Leader, EMS personnel may proceed to the end of the "Contamination Reduction Corridor" to receive patients. Any secondary treatment by EMS personnel should be done in the "Support Area"

3. **Definitions**

   3.1 **Exclusion Zone** (Hot Zone) - Area that encompasses all known or suspected hazardous materials

   3.2 **Contamination Reduction Zone** (Warm Zone) - Area between the "Exclusion Zone" and the "Support Area". "Safe Refuge Area" and "Contamination Reduction Corridor" are set up within this area

   3.3 **Contamination Reduction Corridor** - An area within the "Contamination Reduction Zone" where the actual decontamination takes place. EMS personnel, once cleared, receive patients at the end of the "Contamination Reduction Corridor" and move them to the "Support Area" for secondary treatment

   3.4 **Support Zone** (Cold Zone) - Clean area outside "Contamination Reduction Zone" where equipment and rescue personnel are staged to receive and treat decontaminated patients. Secondary exposure to hazardous materials is not expected in this area and special clothing is not required.
4. **Patient Management**

4.1 Follow the Multi-casualty Incident (MCI) Plan – page 159, if appropriate

4.2 For nerve gas/cyanide exposure:
   - **Patient exposure:**
     - Cyanide Poisoning – page 153
     - Nerve Agent Treatment - page 164, (HazMat trained paramedics only)
   - **Rescuer exposure:** Nerve Agent Autoinjector Administration – page 162

4.3 Paramedics should contact the Base Physician **early** in the incident regarding treatment for other specific exposures

4.4 EMTs and paramedics may only render care within their scope of practice

5. **Scene Management Responsibilities Specific to HazMat Incidents**

5.1 Police Responsibilities

5.1.1 Evacuations ahead of hazard area. Evacuation plans developed under unified command

5.1.2 Traffic control in and around effected area(s)

5.1.3 Incidents on State/Federal Highways joint command is with CHP

5.2 Fire Department Responsibilities

5.2.1 Incident Stabilization

5.2.2 Rescue and medical treatment (all paramedics may provide treatment in Cold Zone)

5.2.3 Assistance to responsible party or agency with development of appropriate cleanup/disposal plan. May include the assistance of other agencies, (i.e. environmental health, etc.)
1. **INTRODUCTION:** Multi-Casualty Incident (MCI) is defined as any incident where the number of injured persons exceeds the day-to-day operating capabilities; requiring additional resources and/or the distribution of patients to multiple hospitals. This will be different for each incident based on time of day, location, resources available etc.

2. An internal notification procedure should be identified by each agency. This procedure must also include notification of ACRECC

3. **INITIATE AN MCI ALERT**

<table>
<thead>
<tr>
<th>MCI LEVELS</th>
<th>►MCI LEVEL I  5-14 patients (approximately)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A suddenly occurring event that overwhelms the routine first response assignment. The number of patients is greater than can be handled by the usual initial response. Depending on the severity of the injuries the system may have adequate resources to respond and transport the patients. Duration of the incident is expected to be less than 1 hour. Examples: Motor vehicle accident, active shooter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>►MCI LEVEL II  15-50 patients (approximately)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A suddenly occurring event that overwhelms the first response assignment and, potentially, additional resources requested within the Operational Area and neighboring counties. Regional medical mutual aid system is activated. An adequate number of additional ambulances are not likely to be immediately available, creating a delay in transporting patients. The duration of incident is expected to be greater than an hour. Examples: Bus crash, train accident, active shooter, improvised explosive device (IED).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>►MCI LEVEL III  50 + patients (approximately)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A suddenly occurring event that overwhelms the first response assignment, additional resources requested within the Operational Area, and mutual aid from neighboring counties (approximately 50+ victims). It is not possible to respond with an adequate number of ambulances to the incident and promptly respond to other requests for ambulance service. Regional medical mutual aid system is activated. Air and ground ambulance and other resources from outside the county will need to be requested. Not only will ambulance service be inadequate but receiving hospitals will be overwhelmed. In an incident of this size the operational area EOC and disaster plan may be activated. Examples: Commercial airline crash, building collapse, active shooter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>WHO MAY INITIATE</th>
<th>Any first arriving unit</th>

<td>Through ACRECC</td>
</tr>
<tr>
<td>WHAT INFORMATION SHOULD BE PROVIDED TO ACRECC</td>
<td>Type of incident</td>
</tr>
<tr>
<td></td>
<td>The location of the incident</td>
</tr>
<tr>
<td></td>
<td>An estimated number of injured</td>
</tr>
<tr>
<td>HOW TO CANCEL AN MCI ALERT</td>
<td>Through ACRECC</td>
</tr>
</tbody>
</table>
4. MANAGEMENT OF MCI INCIDENTS AND PATIENT DISTRIBUTION

4.1 Once an MCI alert is determined by prehospital personnel, Alameda County Regional Emergency Communications (911 dispatch) will be notified and will “Initiate an MCI” under the Reddinet MCI module. ACRECC will immediately send an “ED Capacity poll and general notification” to the hospitals in Alameda County.

4.2 For MCI Levels II & III, ACRECC will notify the EMS Duty Officer of the incident.

4.3 Emergency responders shall perform triage using one of the following triage methods:
   ► The Simple Triage and Rapid Treatment (START) algorithm for adults and JumpSTART for pediatrics
   ► The Sort, Assess, Lifesaving Interventions, Treatment / Transport (SALT) algorithm for patients in all age groups

4.3.1 Acuity based Triage colors for both Triage Tape and Triage Tags are universally accepted as Black (expectant / deceased), Red (immediate / life threatening,), Yellow (delayed / serious non life threatening), and Green (minor / walking wounded). Only Black, Red, Yellow, and green are acceptable triage colors

4.3.2 The use of colored “Triage Tape” upon initial contact with victims at the crisis site is preferred over Triage Tags to identify initial acuity. Triage tags should be used at the external Casualty Collection Point (CCP) outside the crisis site or applied to patients during transport. Acuity guided transport of all patients shall occur in a coordinated and expedient manner.

4.4 Hospital Poll: For MCI incidents involving 15+ patients, ACRECC will send a “bed capacity” poll to all hospitals in Alameda County to confirm bed availability.

4.5 For the duration of the MCI, the Transportation Unit Leader under ICS will determine transportation methods and destinations.

4.6 Whenever possible, patients should be transported to the most appropriate hospital without overloading one particular facility. Every effort will be made to transport trauma patients to a designated trauma hospital. In a Level II or III MCI, transport to a designated trauma center may not always be possible.

4.7 First Round Destination Procedure may be implemented without prior authorization. All Alameda County receiving hospitals should prepare to receive patients, especially those in close proximity to the incident.

<table>

<tr>
<td>✓ Four (4) “Delayed” and/or “Minor”</td>
</tr>
</tbody>
</table>
4.8 ACRECC in conjunction with the incident command structure will track patient numbers, acuity and destinations in ReddiNet in as close to real-time as possible. ReddiNet will serve as the primary mechanism notifying receiving facilities of the number and acuity of incoming patients. Receiving hospitals will enter patient names and other relevant information into ReddiNet. This will facilitate patient accountability and reunification. On scene EMS Supervisors may also have the ability to enter information into ReddiNet.

4.9 Verbal notification to hospitals: In a Level I MCI, transporting units should contact the receiving hospital enroute to give an abbreviated report on the patient(s) status and ETA. In a Level II or III MCI, if ReddiNet is unavailable or non-functional, a medical communications coordinator should be designated to notify receiving facilities of the number and acuity of incoming patients.

4.10 Incident Log - The Transportation Unit Leader should maintain an incident log.

4.11 The on-scene Incident Commander or designee (i.e., Medical Group Supervisor or Transportation Unit Leader) should contact ACRECC during and at the conclusion of the MCI to provide and reconcile patient tracking information to ensure accountability.

5. **RESOURCE MANAGEMENT** - The Incident Commander has the overall responsibility for developing objectives and requesting the necessary resources required to mitigate the incident. There will be no self-dispatching. Clear communications between all involved agencies is imperative.

5.1 The following items are MCI Management points to consider:

- The three “T’s” ensure that Triage, Treatment and Transport have been addressed.
- Request resources through the Incident Commander in the early stages of the incident. Ensure adequate personnel and equipment.
- Establish staging areas. Transport Units and/or other units that do not immediately have an assignment should report to the designated staging area and wait for instructions.
- Use a one-way traffic pattern. Transport units should be staged to assure good access and egress from Loading Area.
- All incoming units drop off required EMS equipment at a designated location.
- County Disaster Trailers shall be requested through ACRECC.

5.2 Use ICS identification vests. At a minimum the IC, Medical Group Supervisor, Triage and Treatment, and Transportation Unit Leader should be clearly identified with vests.
1. **INTRODUCTION:** Nerve agent auto-injectors are to be used when EMS personnel are exposed to nerve agents (Sarin, Soman, Tabun, VX) and have signs and symptoms of nerve agent exposure, or when ALS personnel treat victims in an MCI situation in the hot zone.

2. **EQUIPMENT:**
   2.1 Mark I autoinjector antidote kit containing:
      - **Atropine** autoinjector (2 mg in 0.7 mL)
      - **Pralidoxime chloride** autoinjector - **2-PAM** (600 mg in 2 mL)
   2.2 Additional atropine (2 mg) autoinjectors

3. **PROCEDURE:** If you experience any or all of the nerve agent poisoning symptoms, you must IMMEDIATELY self-administer the nerve agent antidote (see "Nerve Agent Treatment" - page 164 for signs and symptoms)

3.1 **Injection Site Selection:**
   - The injection site for administration is normally in the outer thigh muscle (Figure 1). It is important that the injections be given into a large muscle area.
   - If the individual is thinly-built, then the injections should be administered into the upper outer quadrant of the buttocks (Figure 2).

3.2 **Arming The Autoinjector:**
   - Immediately put on your protective mask.
   - Remove the antidote kit.
   - With your non-dominant hand, hold the autoinjectors by the plastic clip so that the larger autoinjector is on top and both are positioned in front of you at eye level.
   - With your dominant hand grasp the atropine autoinjector (the smaller of the two) with the thumb and first two fingers. DO NOT cover or hold the needle end with your hand, thumb, or fingers-you might accidentally inject yourself. An accidental injection into the hand WILL NOT deliver an effective dose of the antidote, especially if the needle goes through the hand.
   - Pull the injector out of the clip with a smooth motion. The autoinjector is now armed.

3.3 **Administering the antidote to yourself:**
   - Hold the autoinjector with your thumb and two fingers (pencil writing position). Be careful not to inject yourself in the hand.
   - Position the green (needle) end of the injector against the injection site (thigh or buttock). DO NOT inject into areas close to the hip, knee, or thigh bone.
   - Apply firm, even pressure (not jabbing motion) to the injector until it pushes the needle into your thigh (or buttocks). Using a jabbing motion may result in an improper injection or injury to the thigh or buttocks.
   - Hold the injector firmly in place for at least 10 seconds. Firm pressure automatically triggers the coiled spring mechanism. This plunges the needle through the clothing into the muscle and at the same time injects the antidote into the muscle tissue.
   - Carefully remove the autoinjector from your injection site.
NERVE AGENT AUTOINJECTOR ADMINISTRATION

Next, pull the 2 PAM injector (the larger of the two) out of the clip
Inject yourself in the same manner as the steps above, holding the black (needle) end against your outer thigh (or buttocks)
Massage the injection sites, if time permits
After administering the first set of injections, wait 5 to 10 minutes
After administering one set of injections, you should initiate decontamination procedures, as necessary, and put on any additional protective clothing
Atropine only may be repeated every 10 - 15 minutes as needed. (Note: multiple doses of atropine may be needed.)

3.4 Administering the antidote to another in the Hot Zone:
Squat, DO NOT kneel, when masking the casualty or administering the nerve agent antidotes to the casualty. Kneeling may force the chemical agent into or through your protective clothing
Mask the casualty
Position the casualty on his or her side (swimmer’s position)
Position yourself near the casualty’s thigh
The procedure for site selection and medication administration is the same as 3.1 – 3.3
Atropine only should be repeated as needed- multiple doses may be needed

4. DOSAGE SCHEME FOR MARK I ADMINISTRATION - via autoinjector
Additional atropine may be needed until a positive response is achieved (decrease in bronchospasm and/or respiratory secretions)

NOTE: While not approved for pediatric use, autoinjectors should be used as initial treatment in children with severe, life-threatening nerve agent toxicity where IV treatment is not possible or available, or a more precise IM dosing would be logistically impossible.
NERVE AGENT TREATMENT

Only specially trained ALS personnel may administer nerve agent antidote medications to patients. (See page 162 for auto-injector procedure)

Nerve agent antidote medications are only given if the patient is showing signs and symptoms of nerve agent poisoning. THEY ARE NOT TO BE GIVEN PROPHYLACTICALLY.

This policy is to be used in conjunction with page 157 (HazMat).

Note: A decrease in bronchospasm and respiratory secretions are the best indicators of a positive response to atropine and 2-PAM therapy.

NERVE AGENT TREATMENT

If patient exposed:
- Strip off clothing
- Blot off the agent
- Flush area with large amounts of water
- Cover affected area

Warm Zone
Mild to Severe Exposures

*IV/ IO NS

Atropine IV/ IO or IM:
- Adult: 2mg
- Child: 0.02 mg/kg - minimum dose 0.1 mg
  (see note)

^Pralidoxime (2-PAM) IV/ IO or IM
- Adult: 1-2 grams
- Child: 20-40 mg/kg
  maximum 1 gram
May repeat in severe exposures

Treat seizures with
Diazepam
- Adult: 5-10 mg IV/ IO as needed
- Child: 0.1-0.3 mg/kg – repeat at 0.05 - 0.1 mg/kg in 10 minutes if needed

Hot Zone
Severe Exposures Only

*Atropine IM only:
- Adult/Adolescent: 2 mg
- Child: < 2 years 0.5 mg
  2-10 years 1 mg
  (see note)

^Atropine IM only: Adult/Adolescent - 2 mg
Child: < 2 years 0.5 mg
2-10 years 1 mg
(see note)

Note: In a moderate to severe exposure – repeat as needed until a positive response is achieved

**Pralidoxime (2-PAM) IM only:
- Adult/Adolescent: 1-2 grams
- Child: 20 mg/kg
  maximum 1 gram
May repeat in severe exposures

Treat seizures with
Midazolam IM only
- Adult/Adolescent: 5 mg
- Child: 0.1 mg/kg
  (maximum 5 mg)

Note: MMRS providers may use
Diazepam Autoinjector
10 mg IM - ADULTS ONLY

*See page 162 for autoinjector use in the hot zone. Document the number of autoinjectors administered to the victim

^Administer 2-PAM as soon as possible, especially for agents that ‘age’ quickly
**SUSPICIOUS POWDER PROCESS**

**Initial notification to 9-1-1**

**Police Response, Possible Haz-Mat Response**

**Assessment based on initial information/impression**

**Immediate rule-out**
(e.g. sugar spilled on counter, detergent spilled on grocery store floor)

**Possible Anthrax or other threat**
Substance still suspicious, (or overt threat)

- **Notify FBI**
- **FBI Protocols**
- **FBI may direct**
- **CADHS State Lab TEST**
- **Still Suspicious?**
  - **Yes**
  - **Negative**
    - Notification via Law Enforcement
  - **No or negative**
    - **Positive**
      - Notification via Public Health

**Unlikely to be Anthrax or other threat**
Substance unknown, still needs to be identified

- **Notify Environmental Health**
- **Alameda County Lab TEST**
- **Still Suspicious?**
  - **Yes**
  - **Negative**
    - Notification via Law Enforcement

Poisoning | Ingestion | Overdose (Adult) - 44
ROSC - 48
Shock (Adult) - 54
Shock (Pedi) - 81
fluid resuscitation - 12
fluid resuscitation (burns) - 5
fracture - 13

G
gestational age - 67
glucagon
   ALOC (Adult) - 37
   ALOC (Pedi) - 64
   Seizure (Adult) - 51
glucose paste
   ALOC (Adult) - 37
   ALOC (Pedi) - 64
   Seizure (Adult) - 51
   Seizure (Pedi) - 78
grief support - 105

H
H1N1 - 18
handheld nebulizer - 36, 47, 63
hazardous materials incident - 157
head-tilt/ chin-lift - 118
heat emergency - 15
   treatment - 15
Heimlich Maneuver: See also CPR: Abdominal thrusts
high-pressure injury - 13
hot zone - 153, 157
hydrogen cyanide - 151
hyperbaric oxygen - 22
Hyperkalemia - 10, 14
hypoglycemia - 37, 64
hypothermia - 16, 55, 82, 89
   treatment - 16
hypovolemic shock - 54, 81

I
ICS - Incident Command System - 157, 159
IN: See also intranasal
infection control - 18
infusion devices - 107
ingestion - 44, 71
inhalation injury - 5, 6
initial certification: See also EMT initial certification
intercostal space - 128, 136
interfacility transfers - 106
intranasal - 133
intraosseous infusion - 134, 135
intubation - 119
ipratropium
  Respiratory Distress (Adult) - 47
  Respiratory Distress (Pedi) - 76
ITD - Impedance Threshold Device - 37, 59
ITD - Impedance Threshold Device - procedure - 132
J
jaw-thrust - 118
K
King-LTD - 118, 119
L
laryngoscope - 118
LBRT - Length Based Resuscitation Tape - 70
limb leads - 128
LZ - Landing Zone - 94
M
MCI advisory - 159
MCI alert - 159
mechanical CPR - 37
mechanical CPR device - 10, 11, 37, 59
midazolam
  Seizure (Adult) - 51
  Seizure (Pedi) - 78
  Tachycardia (Adult) - 56
multi-casualty incident - 159
N
naloxone
  ALOC (Adult) - 37
  ALOC (Pedi) - 64
  Neonatal Resus - 67
  Pain Management (Adult) - 43
nausea - 53, 80
nerve agent autoinjector - 162
nerve agents
- sarin - 151
- tabun - 151
- VX - 151
nerve agent treatment - 164
nitroglycerine
- Chest Pain - 39
- Pulmonary Edema / CHF - 45

novel influenza A: See also infection control

O
OB/GYN - 19
obviously dead - 88
ondansetron
- Severe Nausea - 53, 80
on-view an accident - 110
organ donor - 91
organophosphate poisoning - 44, 71
out-of-county burn centers - 8
out-of-county trauma centers - 27
overdose - 44, 71

P
pain management - 43, 68
paramedic consideration (trauma) - 25: See also trauma criteria
partial diversion: See also diversion
PEA - pulseless electrical activity - 72
Pediatric Drug Chart (non LBRT) - 70
pediatric trauma arrest - 26
detritic destination decisions - 77
phenothiazines - 40
physician on scene - 108
physiologic criteria (trauma) - 25: See also trauma criteria
plague - 149
pleural decompression - 136
pneumothorax - 136
poisoning - 44, 71
POLST - Physician Orders for Life-Sustaining Treatment - 89
Pralidoxime chloride: See also 2-Pam
precordial leads - 128
pre-eclampsia - 19
premature infants - 67
prolapsed cord - 19
pulmonary edema - 45
pulseless arrest - 72, 73

Q

R
radiological dispersion device - 155
radio report: See also reporting format
recertification: See also EMT initial certification
reporting format - 137
respiratory distress - 47
respiratory distress (stridor) - 75
respiratory distress (wheezing) - 76
ResQPOD - 132
ricin - 149
ROSC - Return of Spontaneous Circulation - 10, 48, 59

S
scope of practice - 20
sedation
Bradycardia (Adult) - 38
Bradycardia (Pedi) - 66
Pulmonary Edema / CHF - 45
Tachycardia (Adult) - 56
sedation procedure - 138
seizure - 51, 78
